## INTRODUCTION

In the early stages, the use of neoadjuvant treatment is the standard of care in triple negative breast cancers (TNBCs). Patients who achieve a pathological complete response (pCR) with primary therapy have improved survival outcomes. The programmed cell death protein 1 (PD-1) is an immune checkpoint that inhibits T-cell effector function within tissues. Its ligand, PD-L1, has been shown to have high expression in TNBCs. To date, major research efforts are being undertaken to determine the use of **PD-1/PD-L1 immune checkpoint inhibitors in TNBC**. Recent randomized controlled trials (RCTs) have shown promising activity of PD-1/PD-L1 inhibitors in the neo-adjuvant setting.

## **METHODS**

A systematic search of Pubmed. Embase. Cochrane, Clinical trials databases and hand search were utilized to identify RCTs investigating the use of neo-adjuvant PD-1/PD-L1 inhibitors plus standard chemotherapy in TNBC. Trials published up to March 2020 were included. Using the random effects model, pooled Odds ratios (ORs) with 95% confidence intervals (CI) were calculated for pCR. Subgroup analysis of pCR rates based on PD-L1 expression was also done.

The authors state no conflict of interest. The manuscript has not been supported by any source of support, including sponsorship or any financial sources.

## **RESULTS**

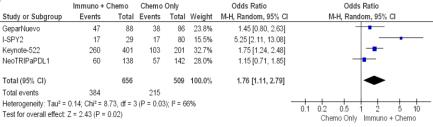

Fig. 2 Four RCTs were included (N=1306) and analyzed. Neoadjuvant immunotherapy plus chemotherapy showed significant pCR benefit of 58.5% vs 42.2% compared to chemotherapy alone (OR1.76, 95%Cl1.11-2.79,P<0.02).

	Immuno + Chemo		Chemo Only		Odds Ratio		Odds Ratio
Study or Subgroup	Events	Total	Events	Total	Weight	M-H, Random, 95% CI	M-H, Random, 95% CI
1.2.1 PD-L1 Positive							
GeparNuevo	40	69	35	69	15.0%	1.34 [0.68, 2.62]	+-
Keynote-522	230	334	90	164	45.7%	1.82 [1.24, 2.67]	-
NeoTRIPaPDL1	41	79	37	77	17.2%	1.17 [0.62, 2.19]	<del>-</del>
Subtotal (95% CI)		482		310	77.9%	1.55 [1.16, 2.09]	•

Heterogeneity: Tau <sup>2</sup> =	0.00; Chi <sup>2</sup> = 1	63, df = 2	2 (P = 0.44	4); I <sup>2</sup> = 0	%		
Test for overall effect:	Z = 2.93 (P =	0.003)					
Fig. 3	Subarou	n ana	alvsis	base	ed on	PD-L1 expression	showed that in the

Fig. 3 Subgroup analysis based on PD-L1 expression showed that in the immunotherapy group, there is a significantly higher pCR rate in the PD-L1-positive population than in the PD-L1 negative group (64.5%vs39.4%, OR1.55, 95%CI 1.16-2.09, p=0.003, I2 = 0%).

## CONCLUSIONS

PD-1/PD-L1 inhibitors combined with chemotherapy was associated with increased pCR rates in TNBC, hence, supporting its use in the neo-adjuvant setting. Subgroup analysis showed that the benefit of adding immunotherapy was more significant in those with PD-L1-expressing tumors. This indicates that the PD-L1 immune marker may have utility in selecting TNBC patients who can benefit more from PD-L1 inhibitors. Longer follow-up of these studies would hopefully show significance in progression-free survival and overall survival.
