GASTRIC CANCER SWOG 9008/INT 0116 RESECTED GASTRIC CANCER

SCHEMA

RESECTED STAGE IB-IV (MO) GASTRIC ADENOCARCINOMA

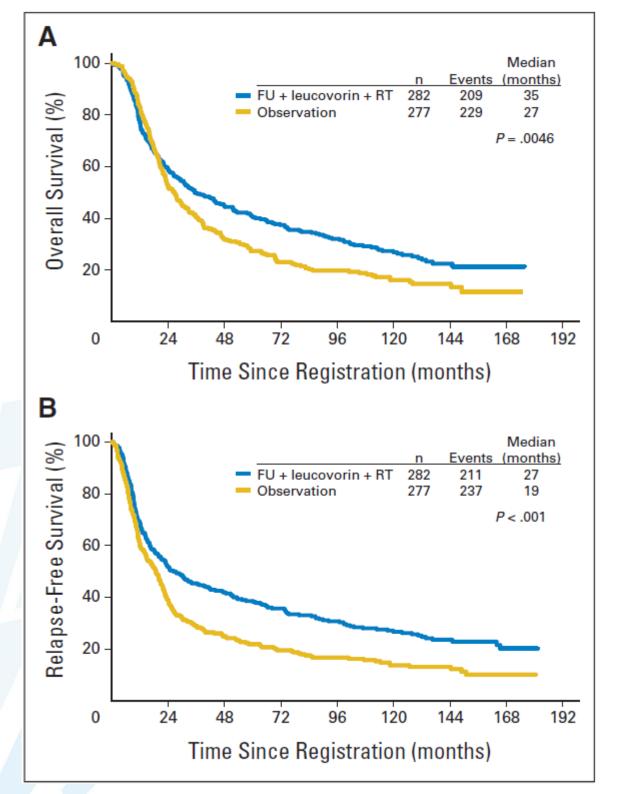

Post-operative Chemoradiotherapy

INT 0119 - SWOG 9008

	Surgery	Surgery chemo RT	p-value
Median DFS	19 months	30 months	p=0.001
3y survival Med. Survival	40% 27 months	50% 36 months	p=0.03

Macdonald J et al, NEJM 2001

Smalley et al, JCO 2012

Post-operative Chemoradiotherapy

INT 0116:

- Significant improvement in overall survival and disease free survival
- Effect mainly on local failure rate (19 vs 29%)
- Acceptable toxicity
 - → New standard?

But:

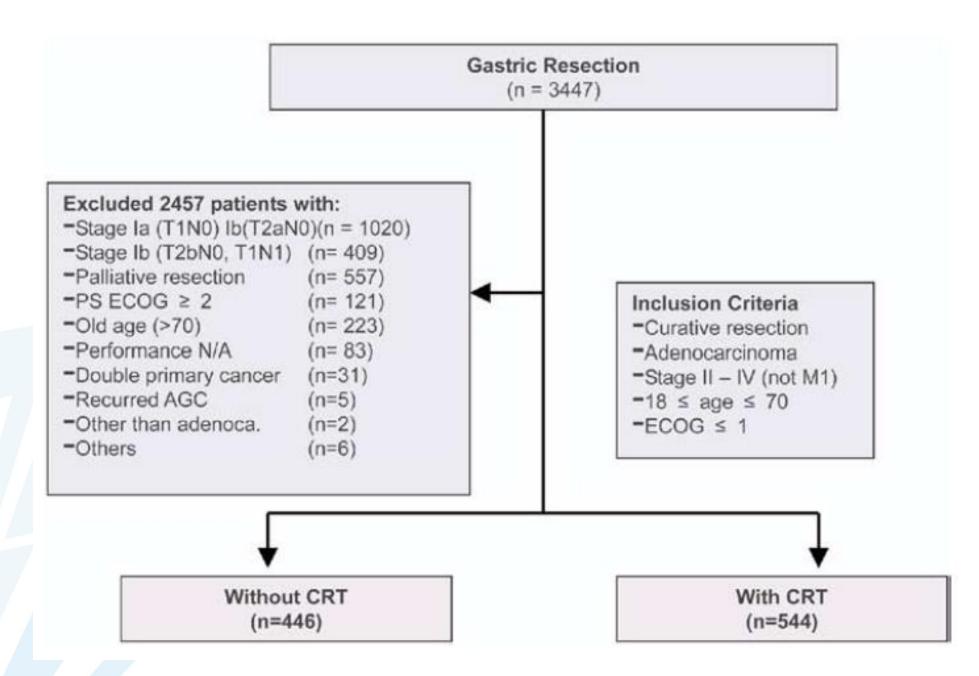

- Randomization after surgery
- No optimal surgery: 54% < D1 resection
- RT: careful planning experience!
- Chemotherapy regimen: not optimal
- Few patients in stage IB (n=39)
- Results not completely in agreement with what was expected on failure pattern

Drawbacks post-operative chemoradiation

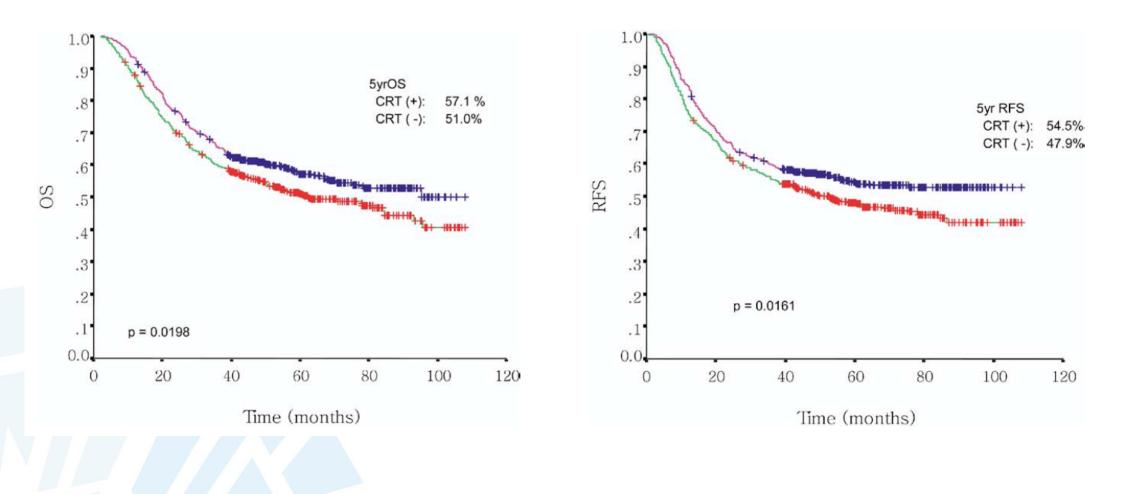

- <u>35%</u> (!) of the RT treatment plans adjusted to avoid toxic effects on critical organs
- Still substantial major toxic effects
 - hematological: 54%
 - gastro-intestinal: 33%
- Only 64% completed postoperative treatment
- Costly treatment

Quality Control Radiotherapy

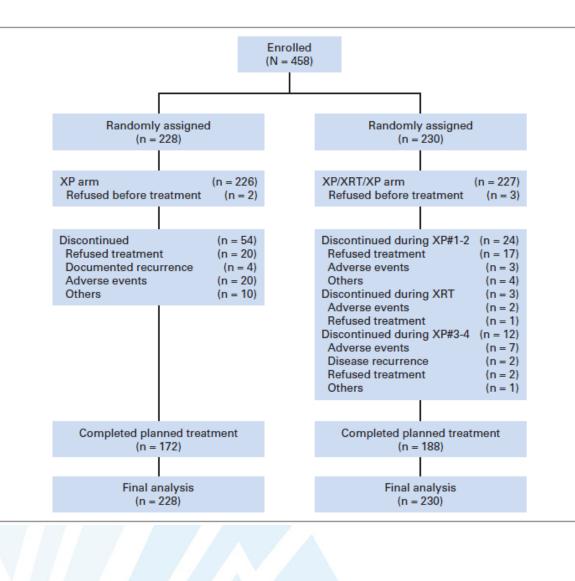

- 35% deviations from protocol
 - 10% potentially lethal errors
 - 9 heart in field
 - 9 both kidneys in field
 - 5 whole liver in field
- 20% excluding tumor bed
- 20% regional lymph nodes
- 10% anastomosis missed

CRITICS Design

Stratified for:

- Center
- Histological type
- Localisation of tumor

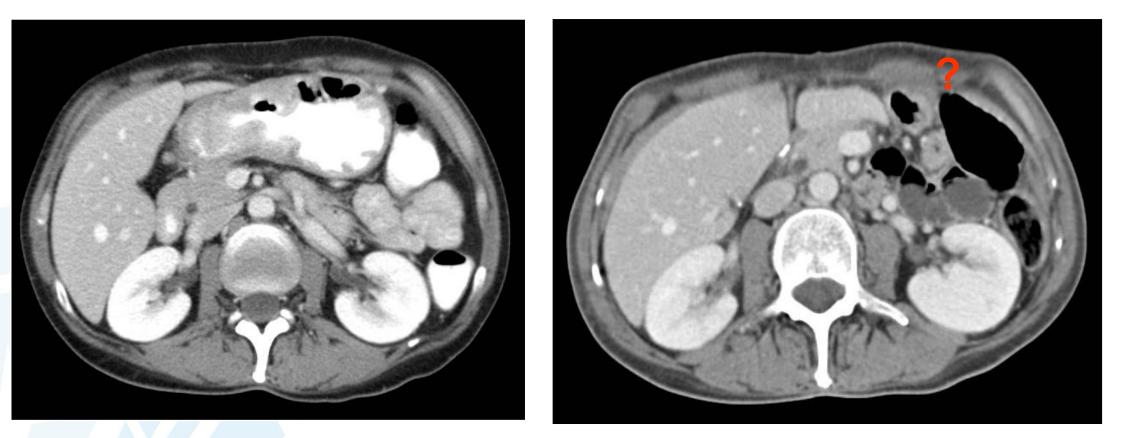

Overview

- Postoperative chemoradiotherapy
- Preoperative chemoradiotherapy
- Palliative radiation
- Technical aspects

Preoperative treatment

- Rationale/potential advantages
 - Enhance resectability
 - Assess response in primary tumour
 - Improve local control
 - Treat micrometastases early
 - Better tolerance than postoperative treatment
- Potential disadvantages
 - Staging less adequate
 - Increased postoperative morbidity
 - Disease progression

Pre-versus post-operative

UICC TNM seventh edition (2009)

- The esophagus includes the GE- junction
- A tumor of which the epicentre is within 5 cm of the GE-junction and which extends into the esophagus is classified and staged as an esophageal tumor

Preoperative chemoradiotherapy

- RESPONDERS (30%-50%)
 - increased resectability rate
 - reduced locoregional recurrences
 - prolonged survival
- NON-RESPONDERS (50%-70%)
 - worse prognosis compared to surgery alone

Trial Schema

Study Design and Key Objectives

Study design:

This is a multicentre, prospective, randomised, stratified, phase II/III clinical trial

Primary objective:

To investigate whether the addition of chemoradiotherapy to chemotherapy is superior to chemotherapy alone in the neoadjuvant setting by improving pCR rates in the first instance (Part I), and subsequently overall survival (Part II), in patients undergoing adequate surgery (minimum D1 dissection) for resectable gastric and gastroesophageal junction cancer

Trial incorporates a QoL and a TR substudy

Statistical Considerations

Assumptions made for sample size calculations

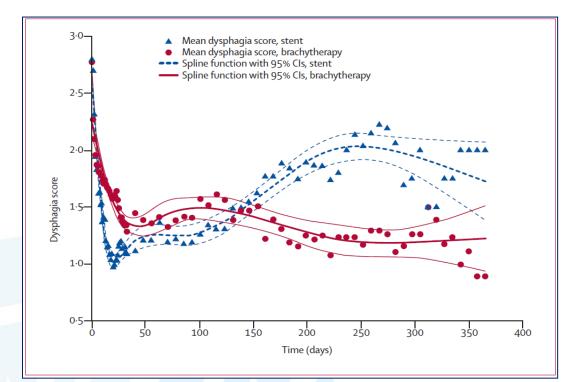

- 5 y survival 40% for standard arm (chemotherapy alone)
- 5 y survival 50% for experimental arm (CRT)
- alpha=0.05 (2-sided)
- beta=0.80
- accrual rate approximately 140 patients per year

Target sample size = 752

Overview

- Postoperative chemoradiotherapy
- Preoperative chemoradiotherapy
- Palliative radiation
- Technical aspects

Palliative radiation

- 209 patients
- Inoperable
- 12 Gy SD vs stent
- BT more effect on dysphagia
- BT less complications
- QoL better after BT

Homs et al, Lancet 2004

Overview

- Postoperative chemoradiotherapy
- Preoperative chemoradiotherapy
- Palliative radiation
- Technical aspects

Technical aspects

- Total dose
- Dose per fraction
- Total treatment time

Targetvolume/OAR

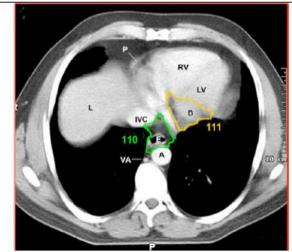

Technique

Radiation schedules used

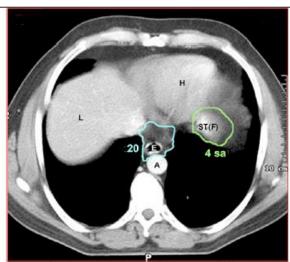

- 35 Gy in 2.3 Gy fractions over 3 weeks
- 45 Gy in 1.5 Gy fractions over 3 weeks
- 40 Gy in 2.7 Gy fractions over 3 weeks
- 41.4 Gy in 1.8 Gy fractions over 5 weeks

THESE SCHEDULES CANNOT BE REGARDED AS STANDARD!

International and Japanese Gastric Cancer Association

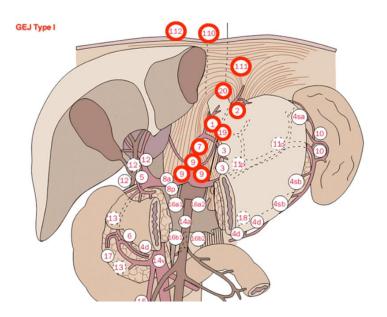

110 - Paraoesophageal LN111 - Supradiaphragmatic LN

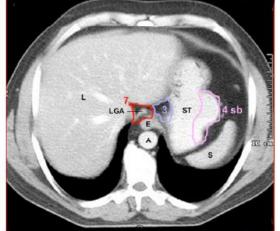

20 - LN in the oesophageal hiatus of the diaphragm4sa - LN along the short gastric vessels

GEJ Type I

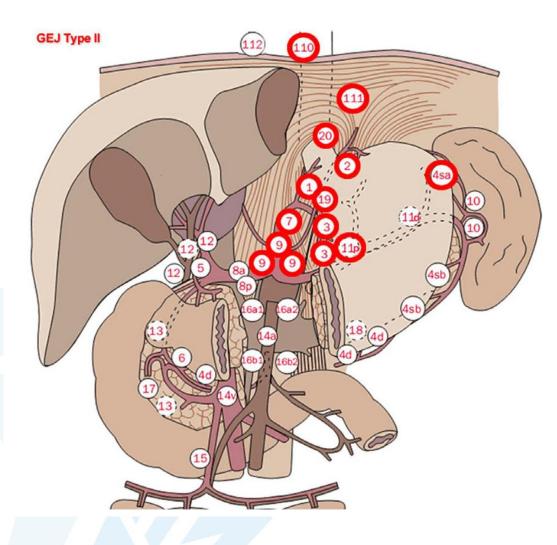

- 1 Right paracardial LN
- 2 Left paracardial LN
- 7 LN along the left gastric artery
- 9 LN around the celiac artery
- 19 Infradiaphragmatic LN
- 20 LN in the oesophageal hiatus of the diaphragm
- 110 Paraoesophageal LN in the lower thorax
- 111 Supradiaphragmatic LN
- 112 Posterior mediastinal LN

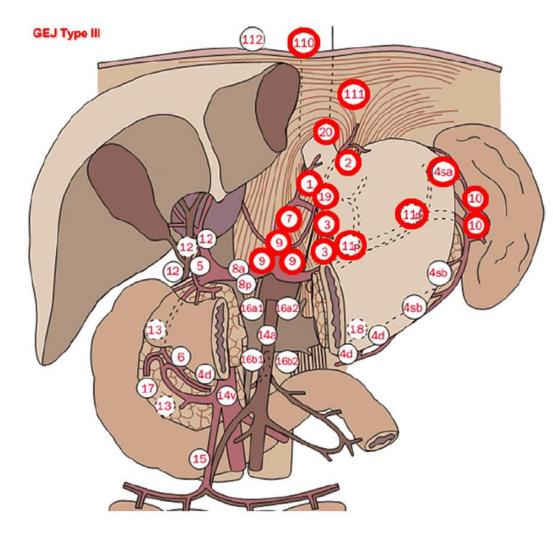

3 - LN along the lesser curvature4sb - LN along the left gastroepiploic vessels

7 - LN along the left gastric artery

Radiotherapy for GE-junction tumors

• Dose:

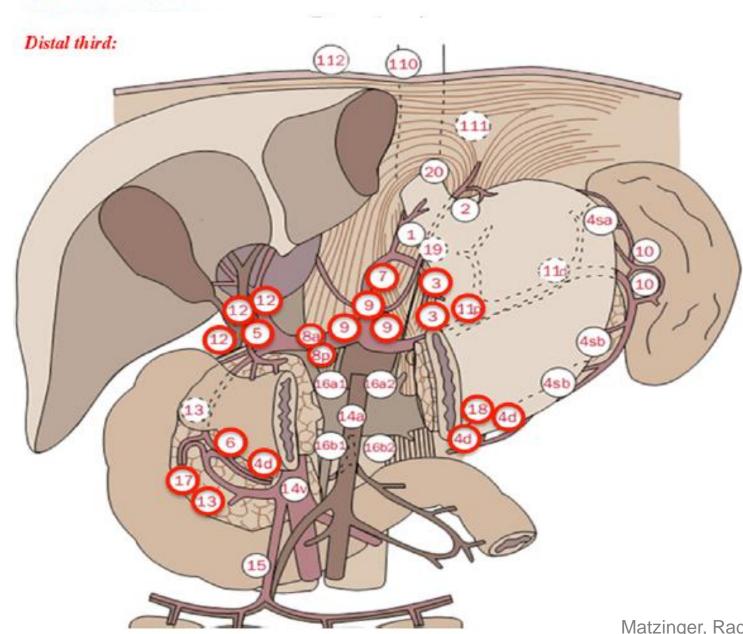

- Preoperative therapy: 40-45 Gy in 1,8-2,0 Gy/fraction in combination with chemotherapy
- Postoperative therapy: 45-50,4 Gy in fractions of 1,8 Gy combined with chemotherapy
- Maximum overall treatment time: 37 days

• Dose limiting critical structures:

OAR	Max. % volume to receive specified dose	Mean organ dose	Max. dose for partial organ irradiation	Maximum dose
Spinal cord				45 Gy
Liver		30 Gy	1/3 liver ≤50 Gy 2/3 liver ≤35Gy	
Kidneys		23 Gy	1/3 kidney ≤35Gy 2/3 kidney ≤20Gy	
Heart	V40 ≤30%			
Lungs	V20 ≤30%	18 Gy		

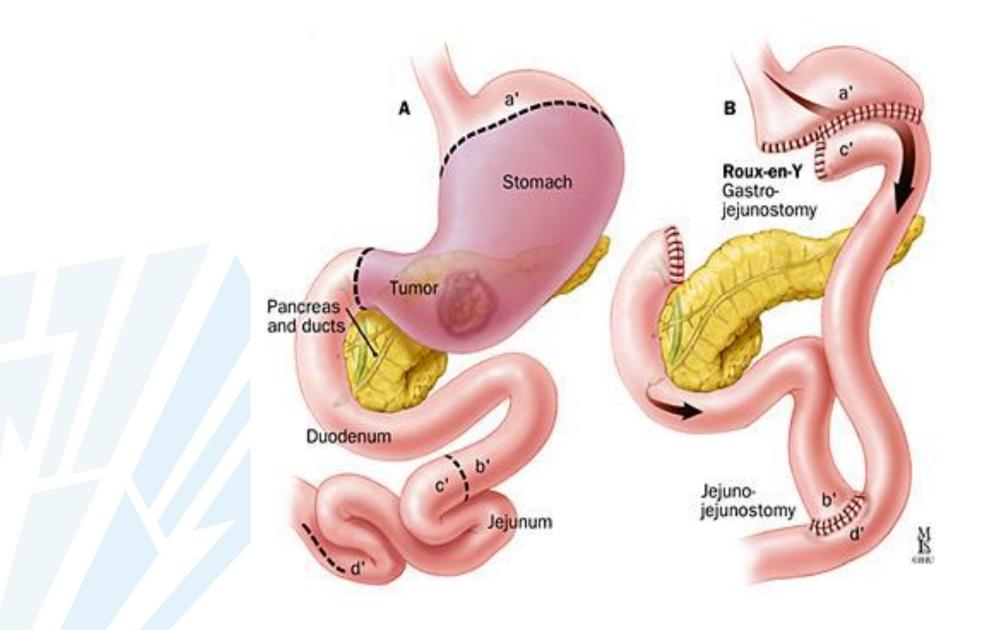

Matzinger, Radiother Oncol 2009

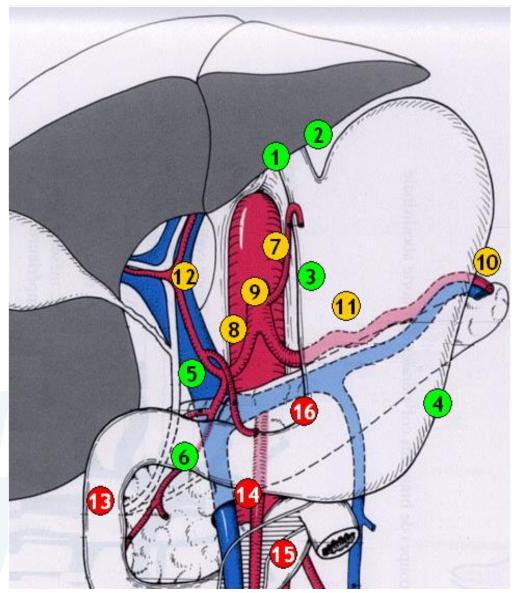

Lymph node regions at risk

Matzinger, Radiother Oncol 2009

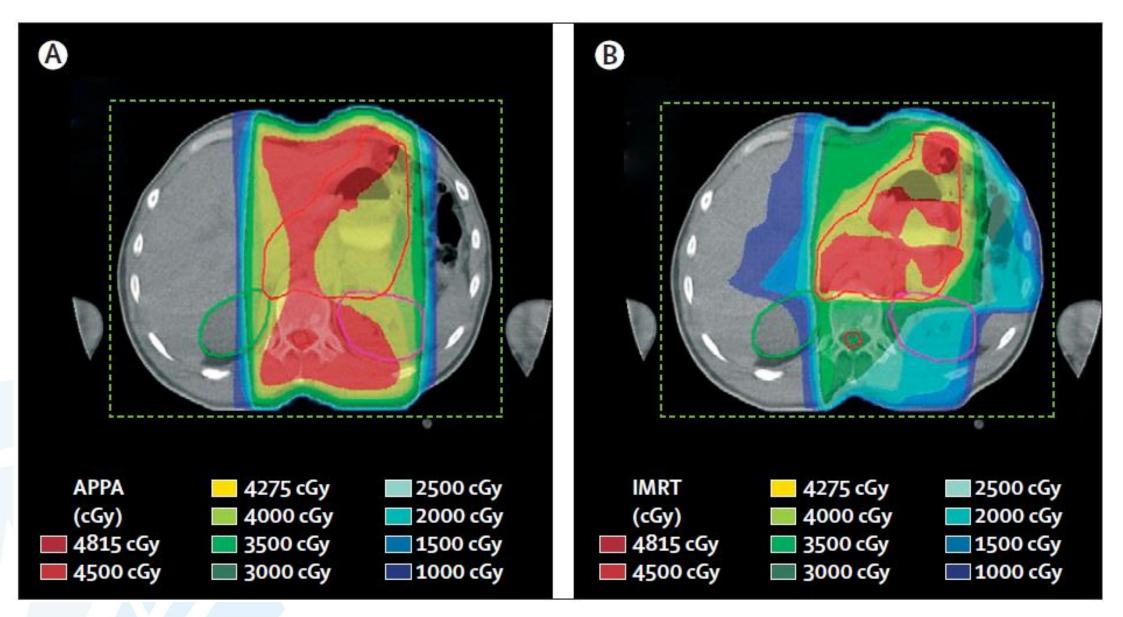

The post-operative setting

1 right paracardial; 2 left paracardial; 3 lesser curvature; 4 greater curvature; 5 suprapyloric; 6 infrapyloric; 7 left gastric artery; 8 common hepatic artery; 9 celiac artery;10 splenic hilum;11 splenic artery; 12 hepatoduodenal ligament;13 posterior surface of the pancreatic head; 14 superior mesenteric vein/artery; 15 middle colic vessels;16: aorta.

Lymph node regions at risk

Hartgrink et al, Lancet 2009

3D vs. IMRT Comparison

"In general, V40 and V50 were kept to <50 and <30%, respectively, for the heart."

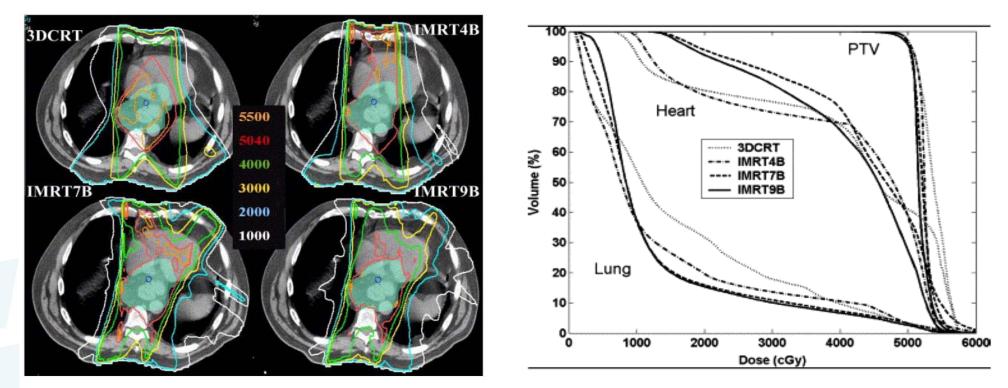

Fig. 1. Sample transverse CT images showing the isodose distributions in the middle of PTV for one of the cases studied.

Fig. 2. DVHs from the 3DCRT and three IMRT plans for the case shown in Fig. 1.

"We gave PTV coverage and lung sparing higher priority than the other structures"

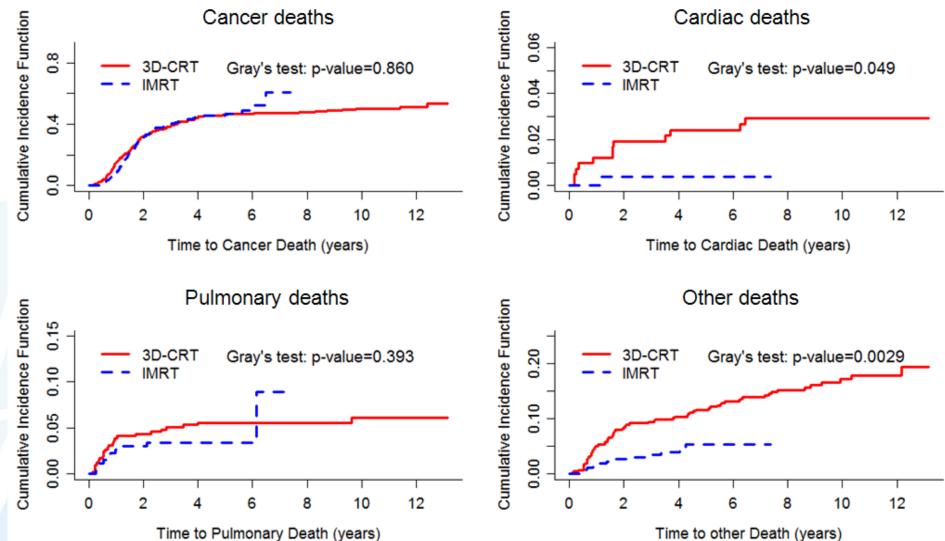

IMRT plans reduced the amount of lung treated compared to 3D-CRT "No clinically meaningful differences were observed with respect to irradiated volumes of spinal cord, heart, liver, or total body integral doses"

Chandra A, et. al, IJROBP 2005

Postoperative complications related to radiation dose to organ at risk

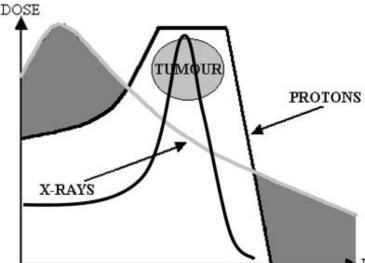

- Higher rates of postoperative pulmonary complications (ARDS, PNA) when large lung volumes receive low doses
 - Total Lung V10 ≥ 40% vs <40% : <u>35%</u> vs <u>8%</u> (p=0.014) (Lee HK et al. 2003)
 - NTCP modeling associated postoperative pulmonary complications to the amount of total lung spared from doses ≥ 5 Gy (Tucker SL et al., 2006)

IMRT has a lower incidence of cardiac and unknown related deaths

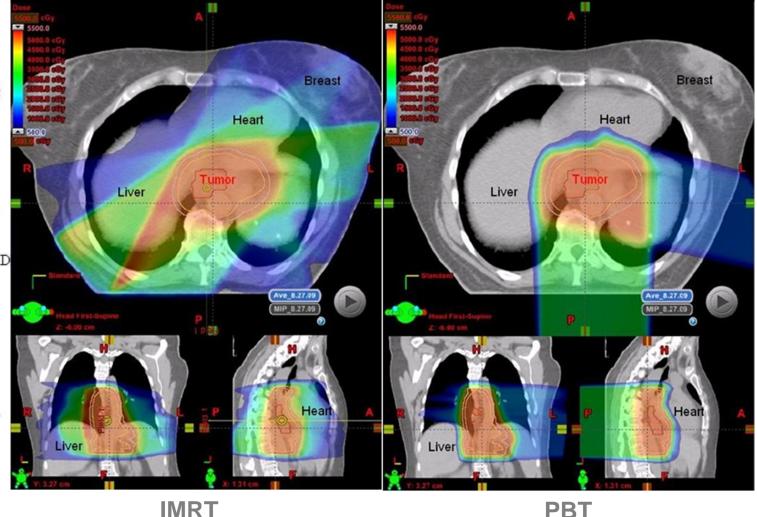

th (years)

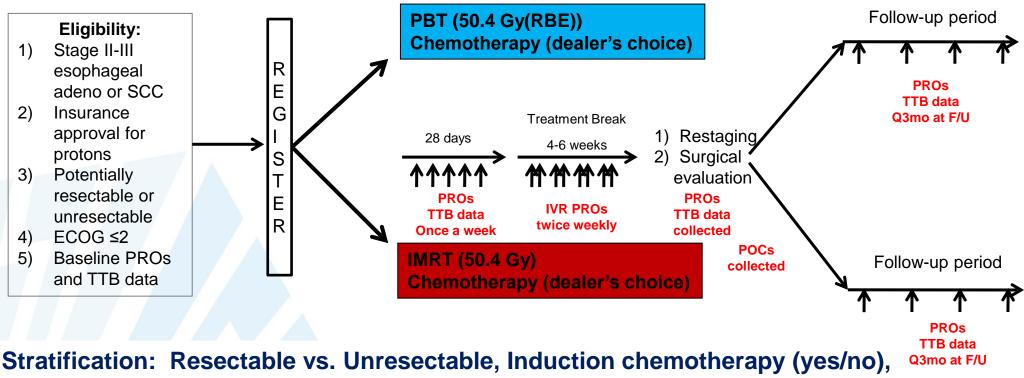

How about protons?

Schematic depth dose diagram of a proton beam Bragg peak, the spread out Bragg peak and a megavoltage X-ray beam The grey shaded areas indicate the extent of dose reduction

Awaiting results from a RCT at MD Anderson

Stage II or III, Adenocarcinoma or SCCA, Age ≥ 65 vs. < 65.

Abbrevations: PROs = Patient Reported and Physician Reported Outcomes; TTB = Total Toxicity Burden form; IVR = Interactive Voice Response system; POCs = Postoperative Complications.

Conclusions GEJ cancer

- Major tumor bulk in esophagus or tumors at transition (Siewert type 1 and 2):
- → Strategy of preoperative CRT
- Major tumor bulk in stomach (Siewert type 3):

Strategy of peri-operative CT awaiting results of Phase III trials

Level II evidence (CROSS/POET)

Conclusions gastric cancer

If sub-optimal surgery (<D1) or N+ disease

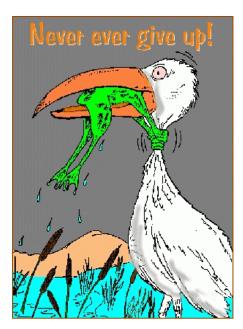

Consider (optimized) post-operative chemoradiation

Indications: (T2b), T3, T4 or N+ M0

Level II evidence (INT0116/ARTIST)

Conclusions

- A multidisciplinary approach is essential in the treatment of this disease!
 - Which type of treatment?
 - Which drugs?
 - Which total dose of radiation/fractionation?
 - Which volumes to irradiate?
