### Personalized medicine for lung cancer: new challenges for pathology

Keith M Kerr

# It is worthwhile finding an actionable genetic alteration in Lung cancer

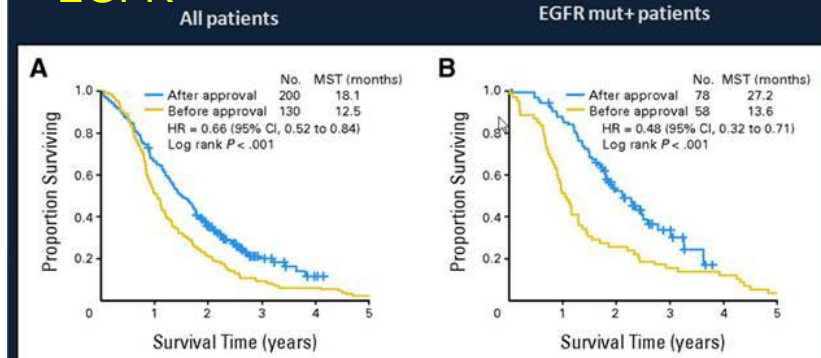

PRESIDENTIAL SYMPOSIUM INCLUDING TOP RATED ABSTRACTS  
TUESDAY, OCTOBER 29, 2013 - 08:15-09:45 WCLC, Sydney

**PL03.07 TREATMENT WITH THERAPIES MATCHED TO ONCOGENIC DRIVERS IMPROVES SURVIVAL IN PATIENTS WITH LUNG CANCERS: RESULTS FROM THE LUNG CANCER MUTATION CONSORTIUM (LCMC)**

Mark G. Kris<sup>1</sup>, Bruce Johnson<sup>2</sup>, Lynne Berry<sup>3</sup>, David Kwiatkowski<sup>4</sup>, et al

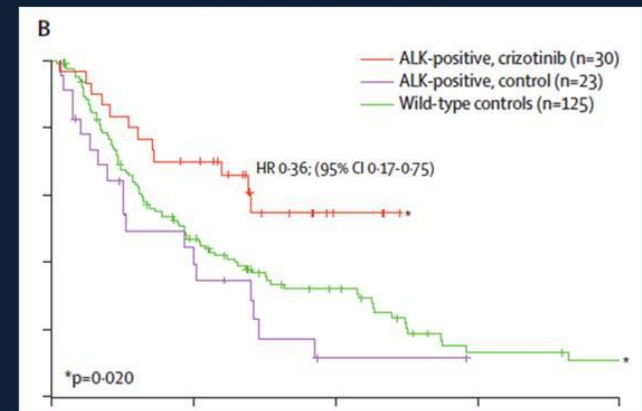

Comparison of survival for patients with lung adenocarcinoma in Japan before and after gefitinib approval

## EGFR

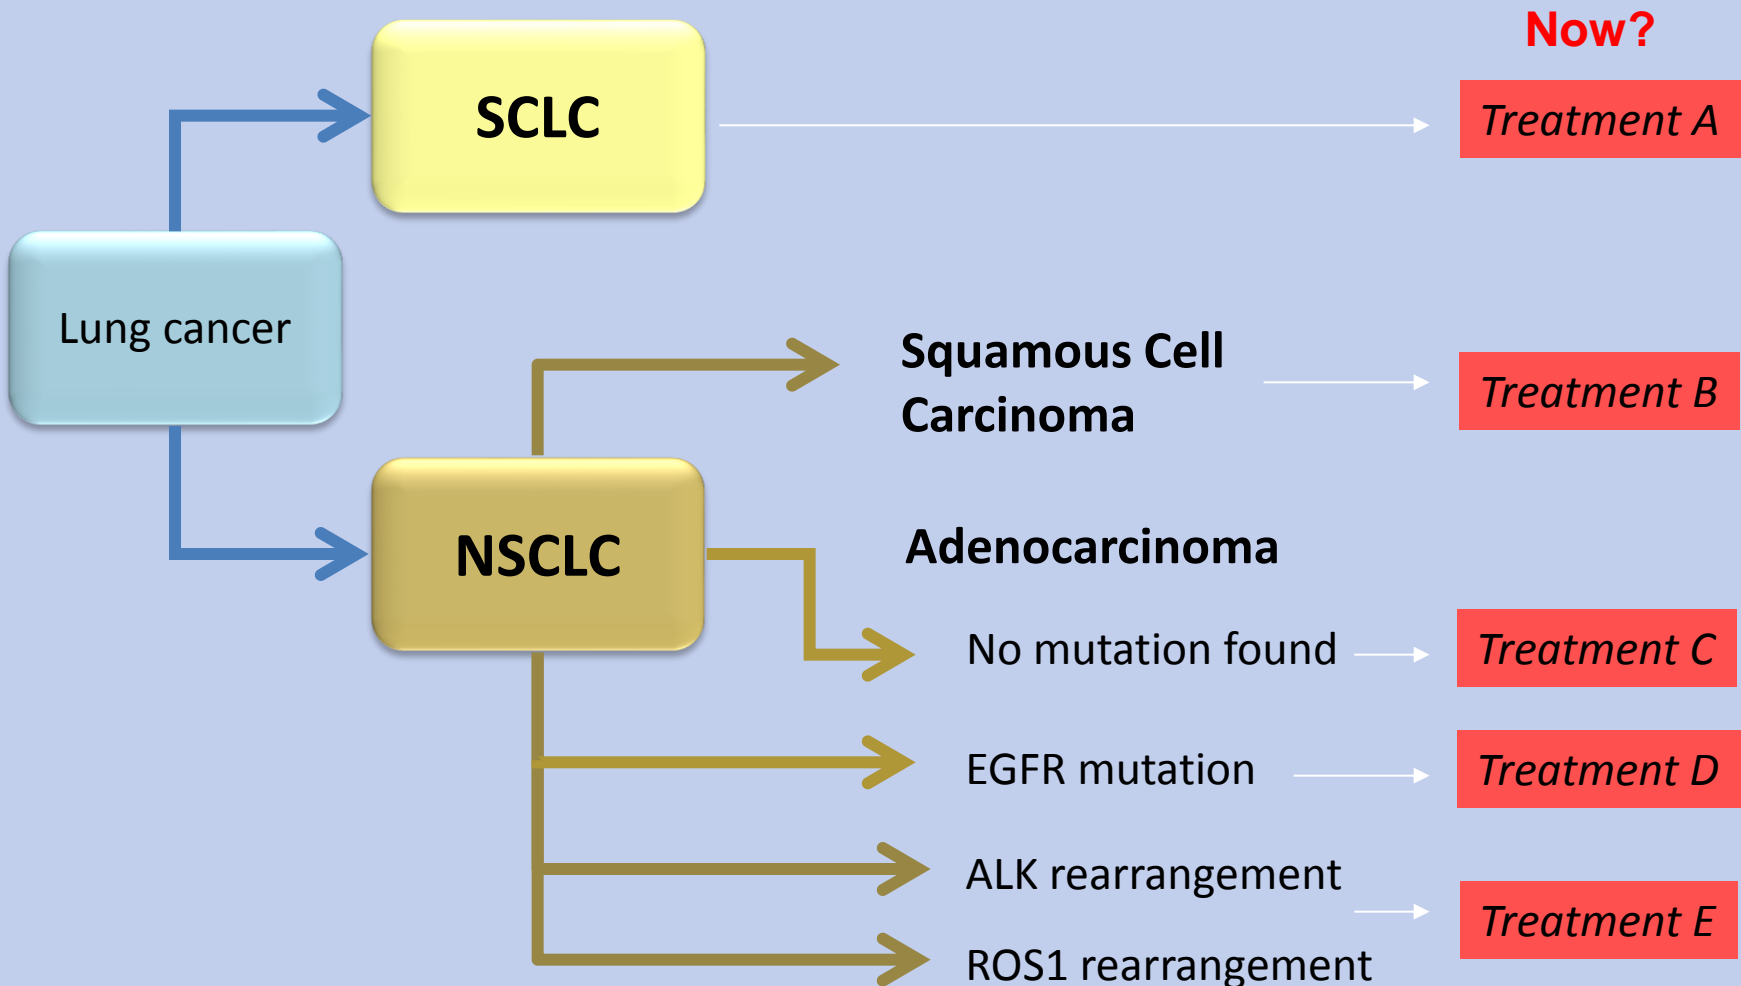

## ALK

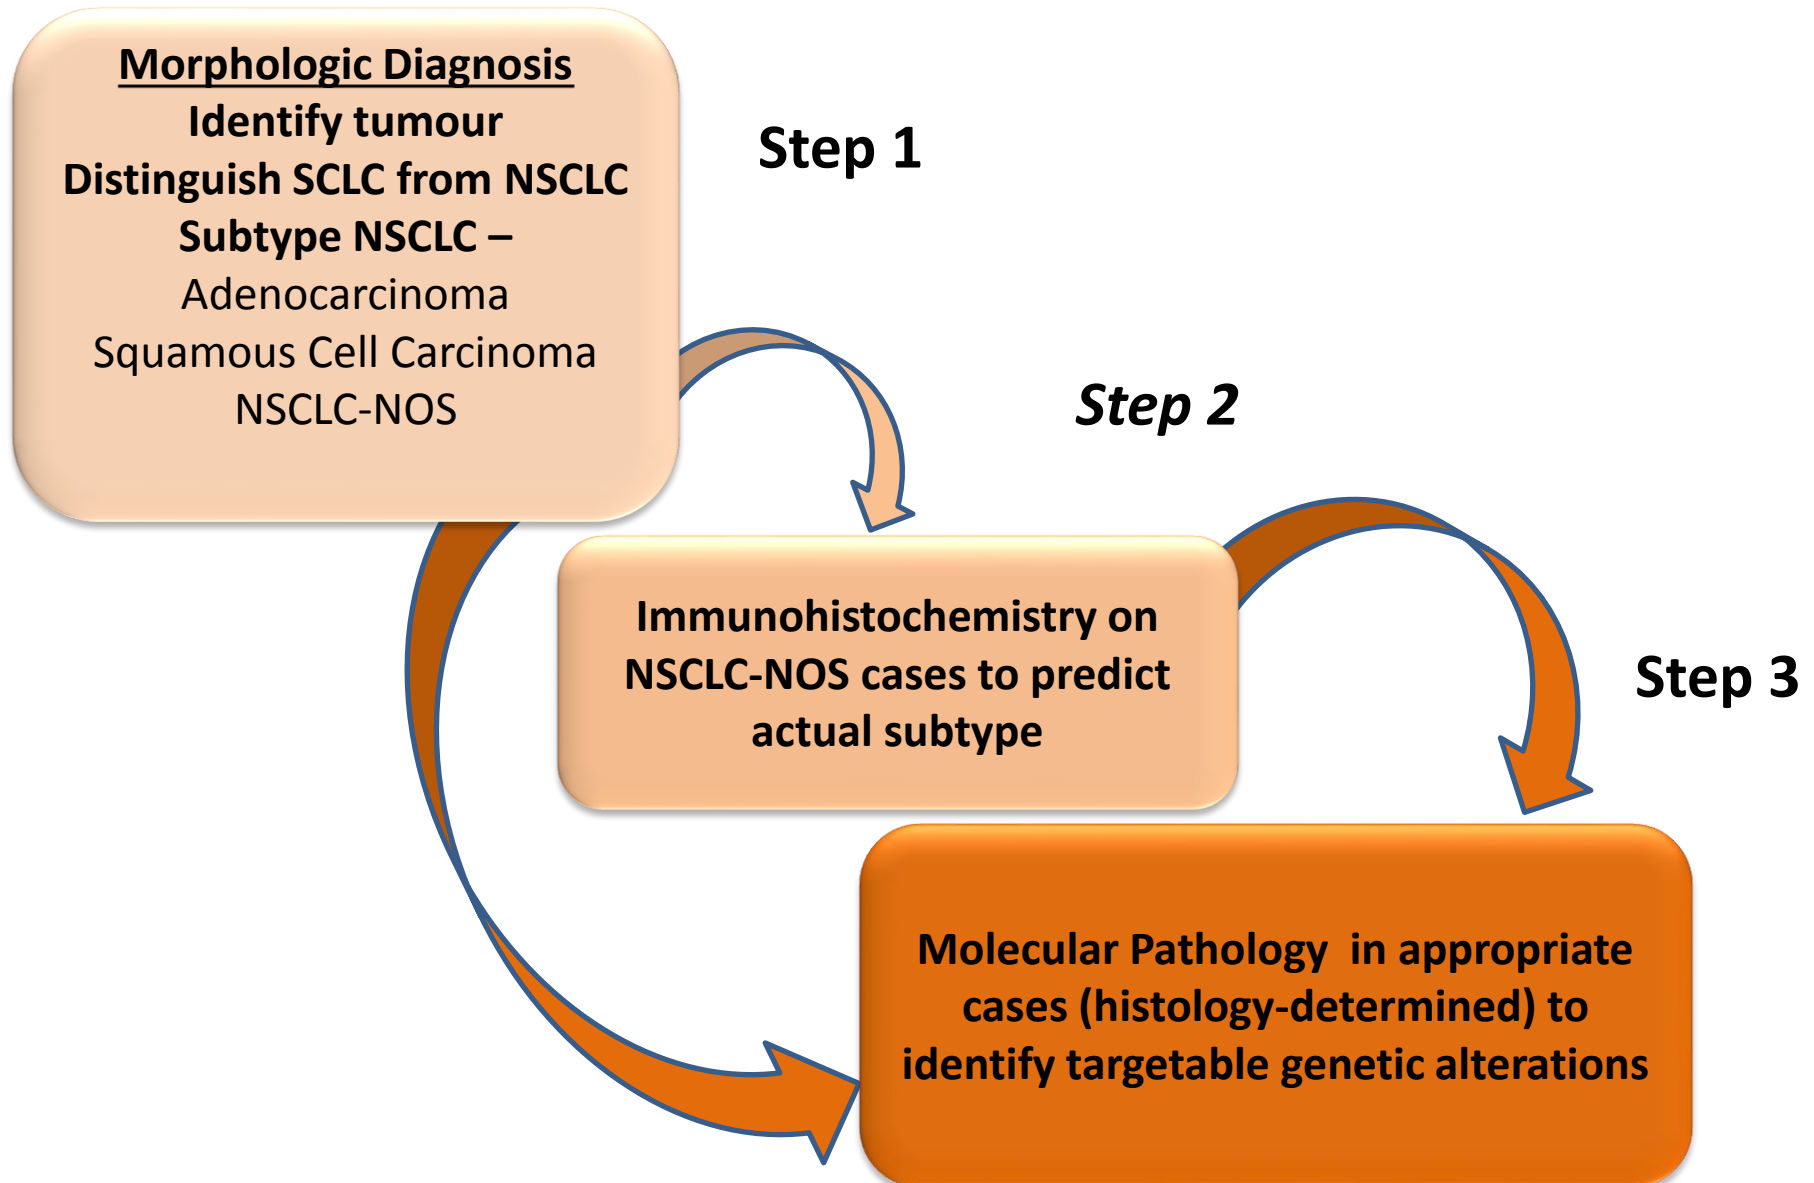

Comparison of survival for patients with lung adenocarcinoma in second line before and after crizotinib approval

# Tumour histology and genotype influences treatment in Lung Cancer

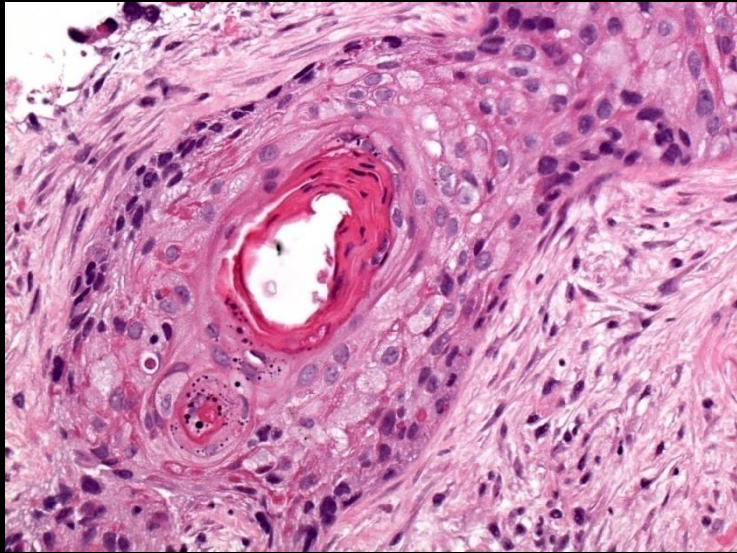

# Lung Cancer Diagnosis

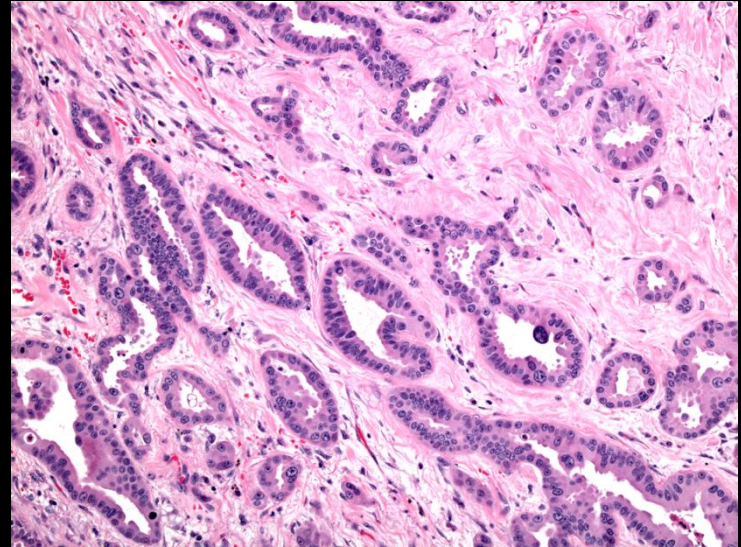

# Histological Subtyping of NSCLC:

## Small sample – biopsy/cytology

Squamous Cell Carcinoma

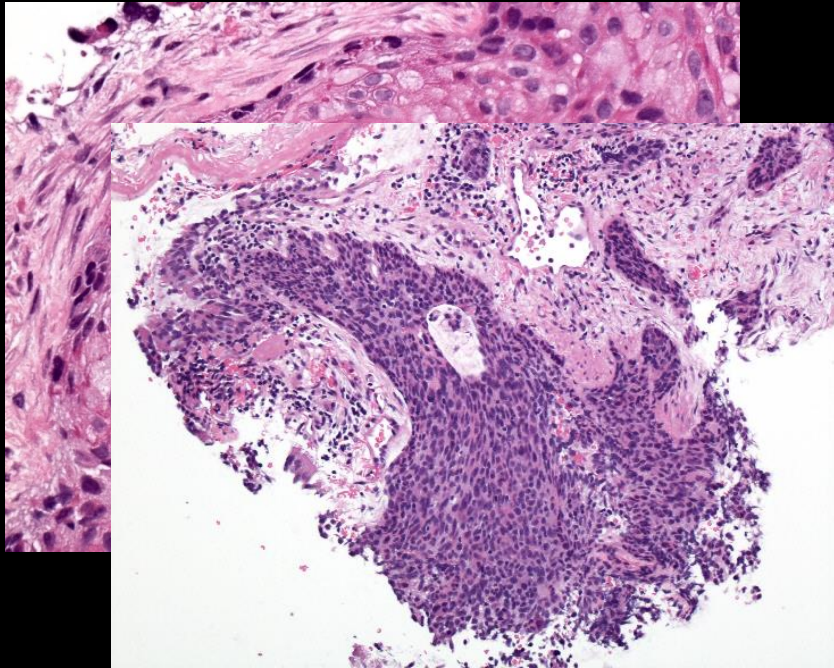

Adenocarcinoma

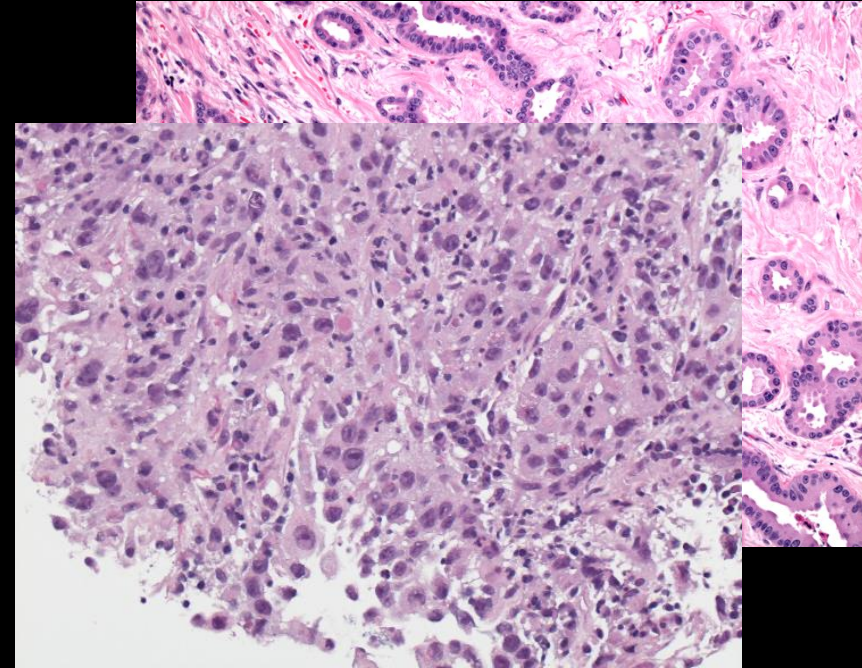

# Histological Subtyping of NSCLC: Small sample – biopsy/cytology

Squamous Cell Carcinoma

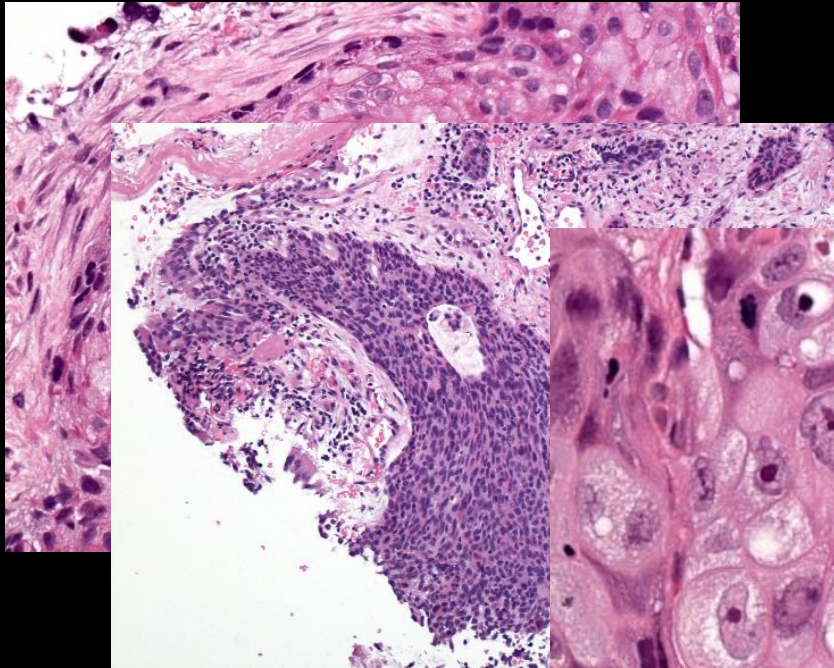

Adenocarcinoma

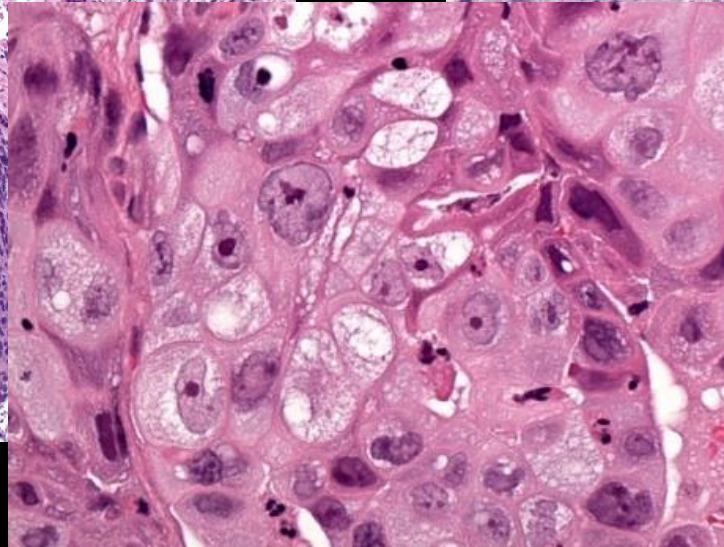

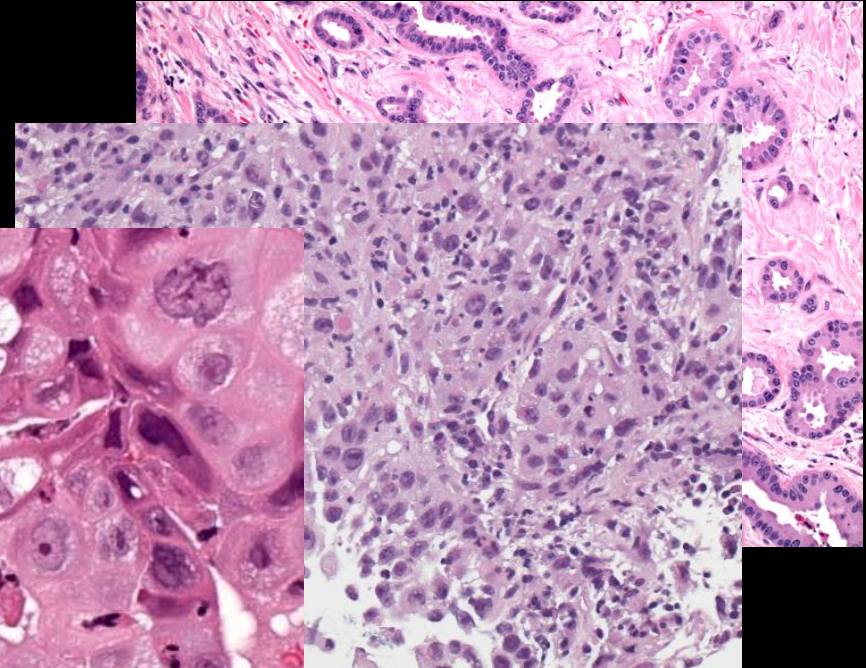

# Histological Subtyping of NSCLC: Small sample – biopsy/cytology

Squamous Cell Carcinoma

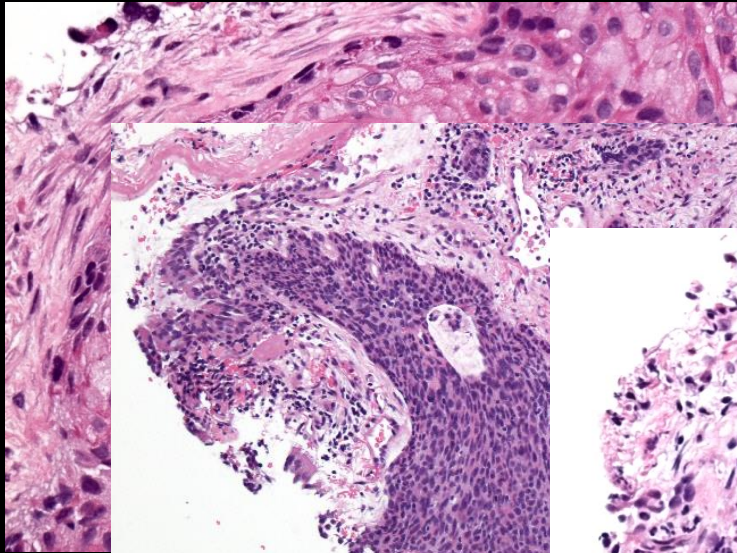

Adenocarcinoma

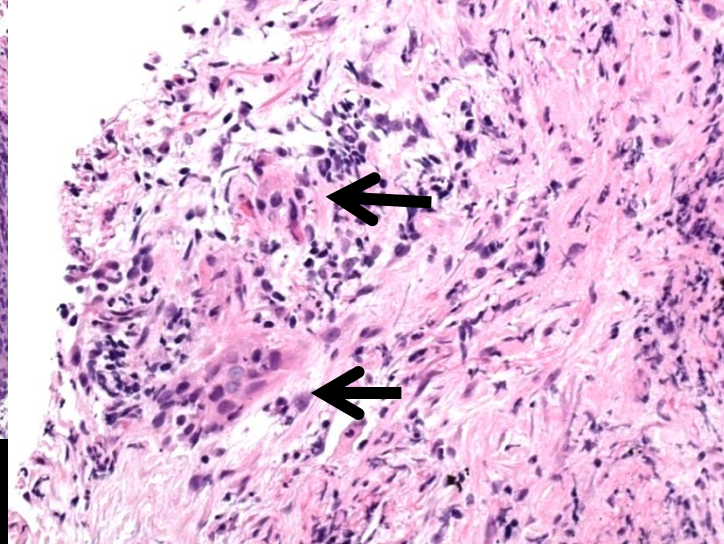

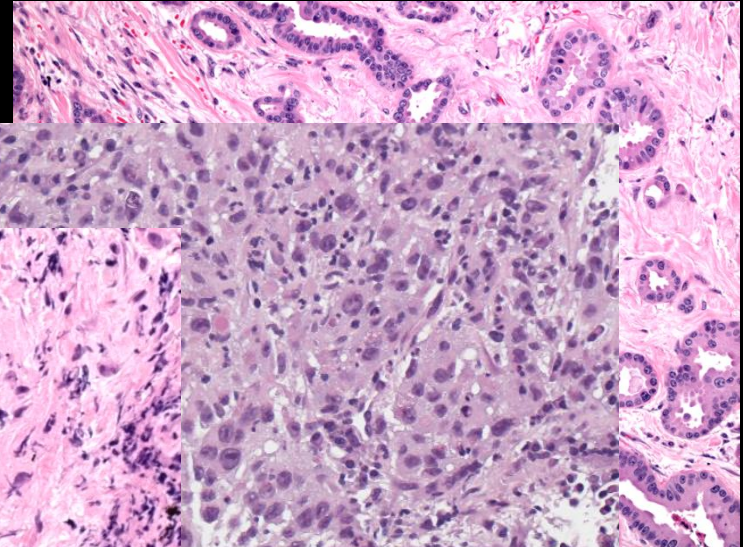

NSCLC-NOS

# Histological Subtyping of NSCLC: Small sample – biopsy/cytology

Squamous Cell Carcinoma

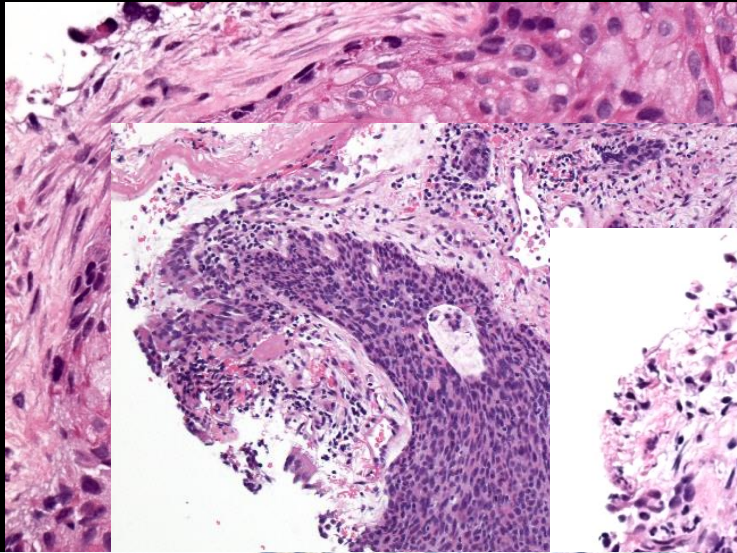

Adenocarcinoma

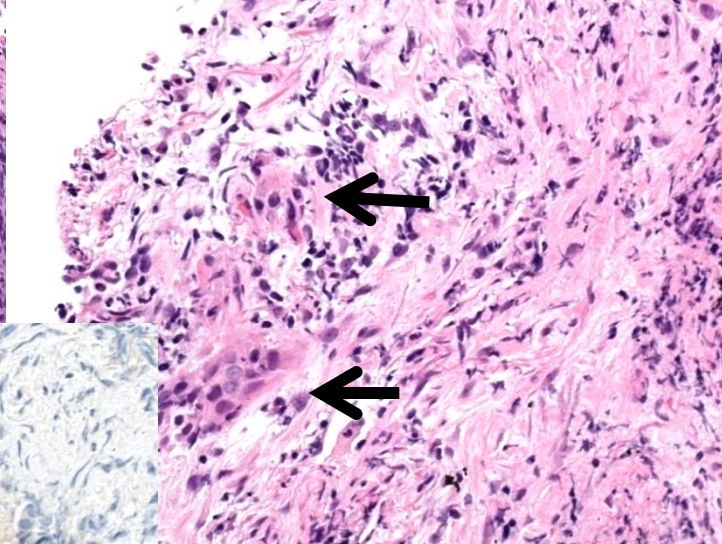

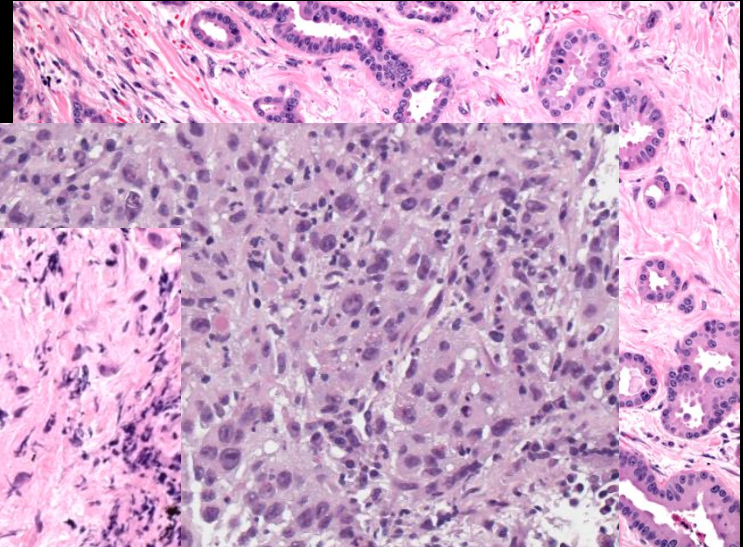

NSCLC-NOS

# Histological Subtyping of NSCLC: Small sample – biopsy/cytology

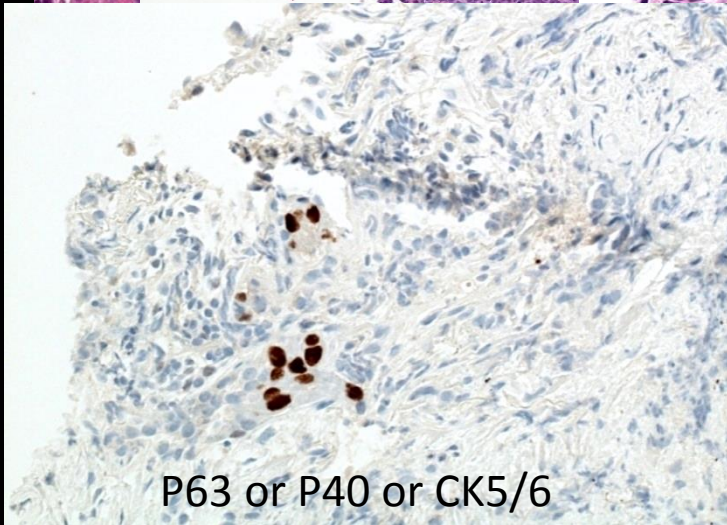

## Squamous Cell Carcinoma

## Adenocarcinoma

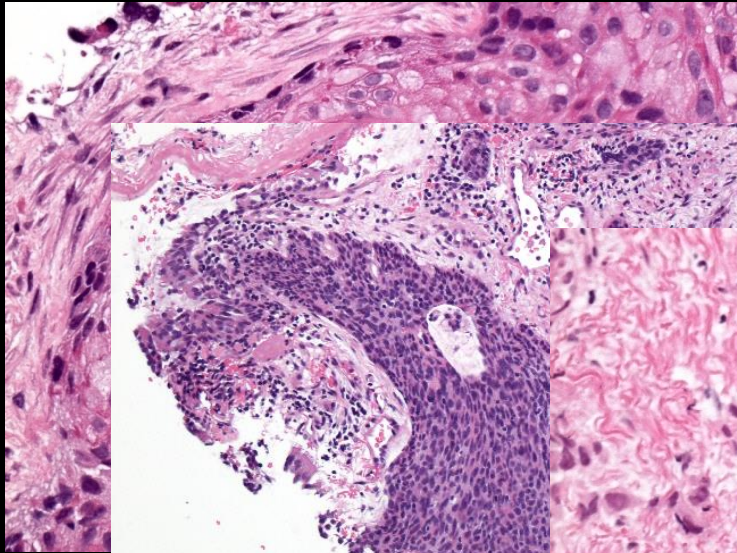

P63 or P40 or CK5/6

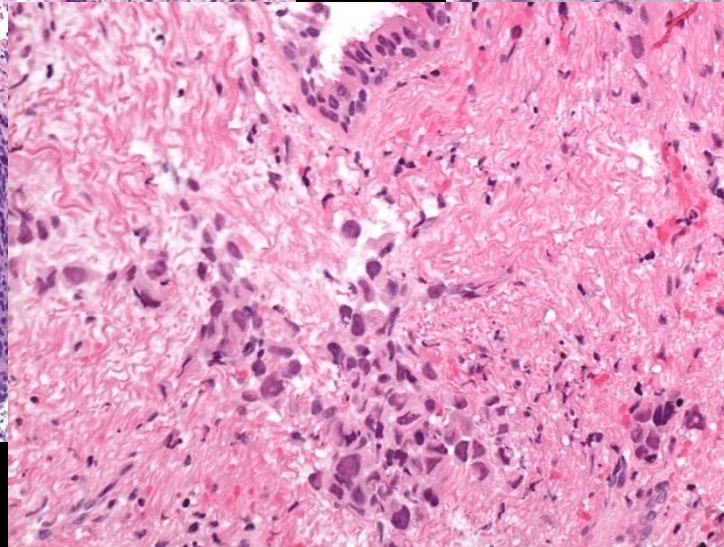

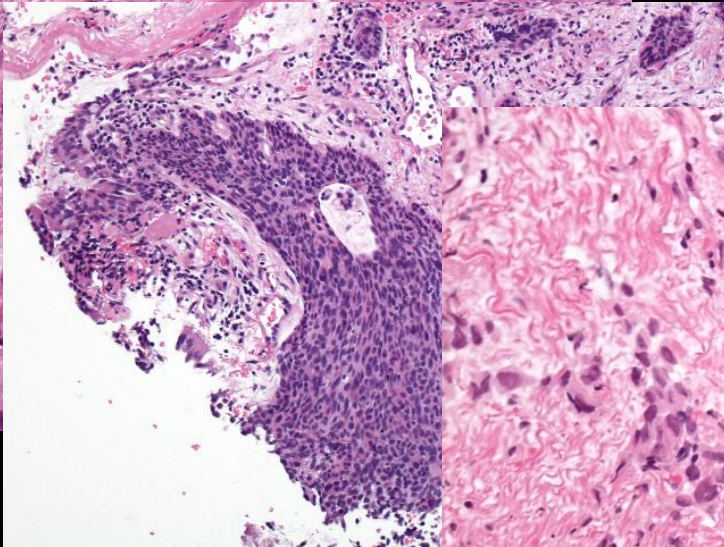

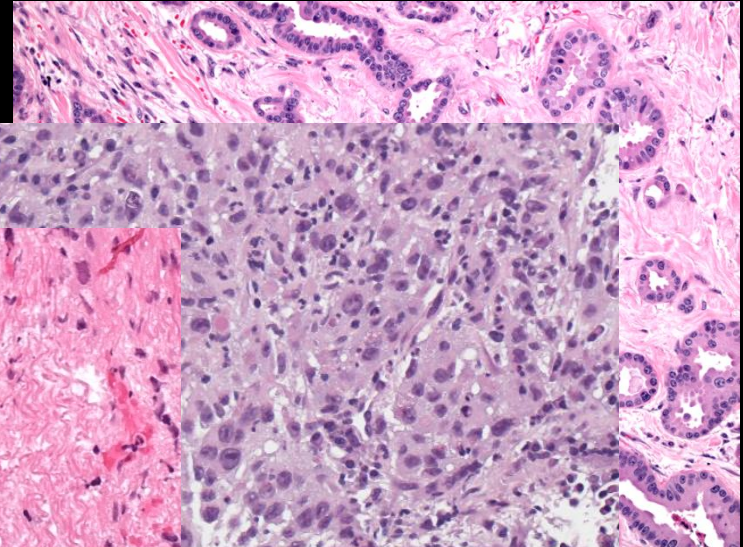

# Histological Subtyping of NSCLC: Small sample – biopsy/cytology

Squamous Cell Carcinoma

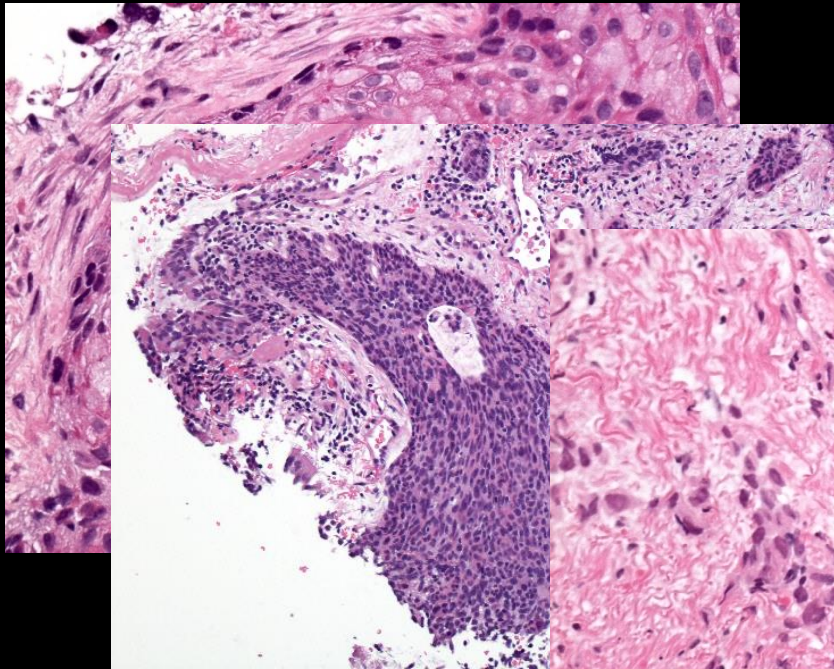

Adenocarcinoma

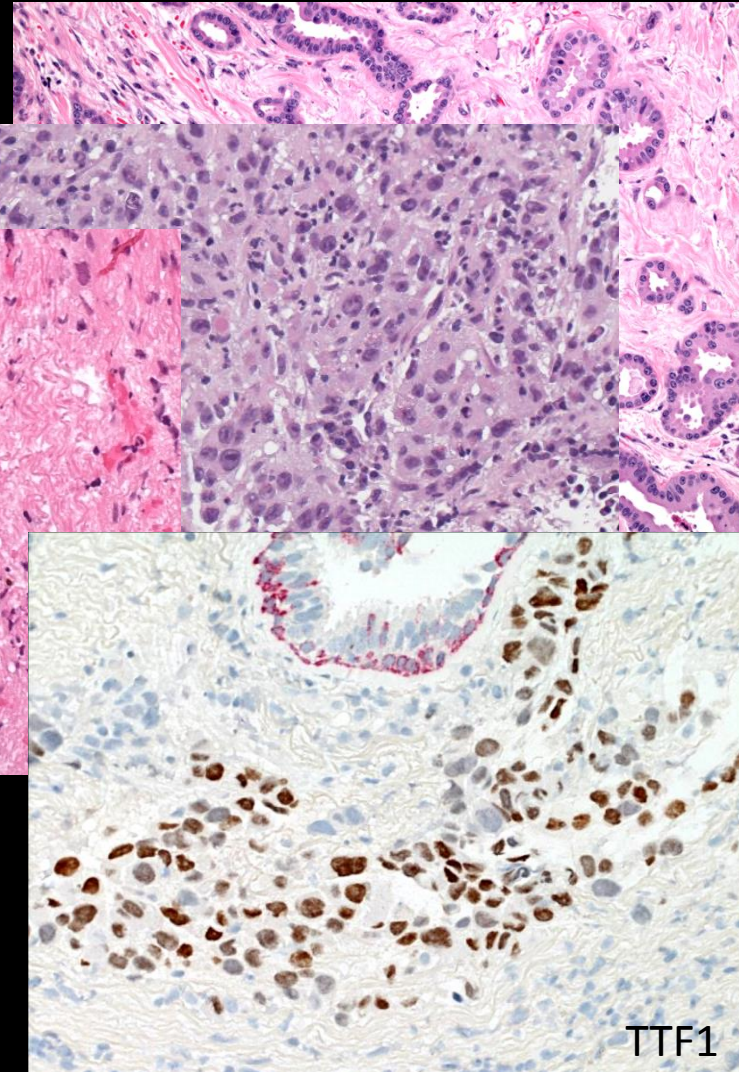

NSCLC-NOS

# Histological Subtyping of NSCLC: Small sample – biopsy/cytology

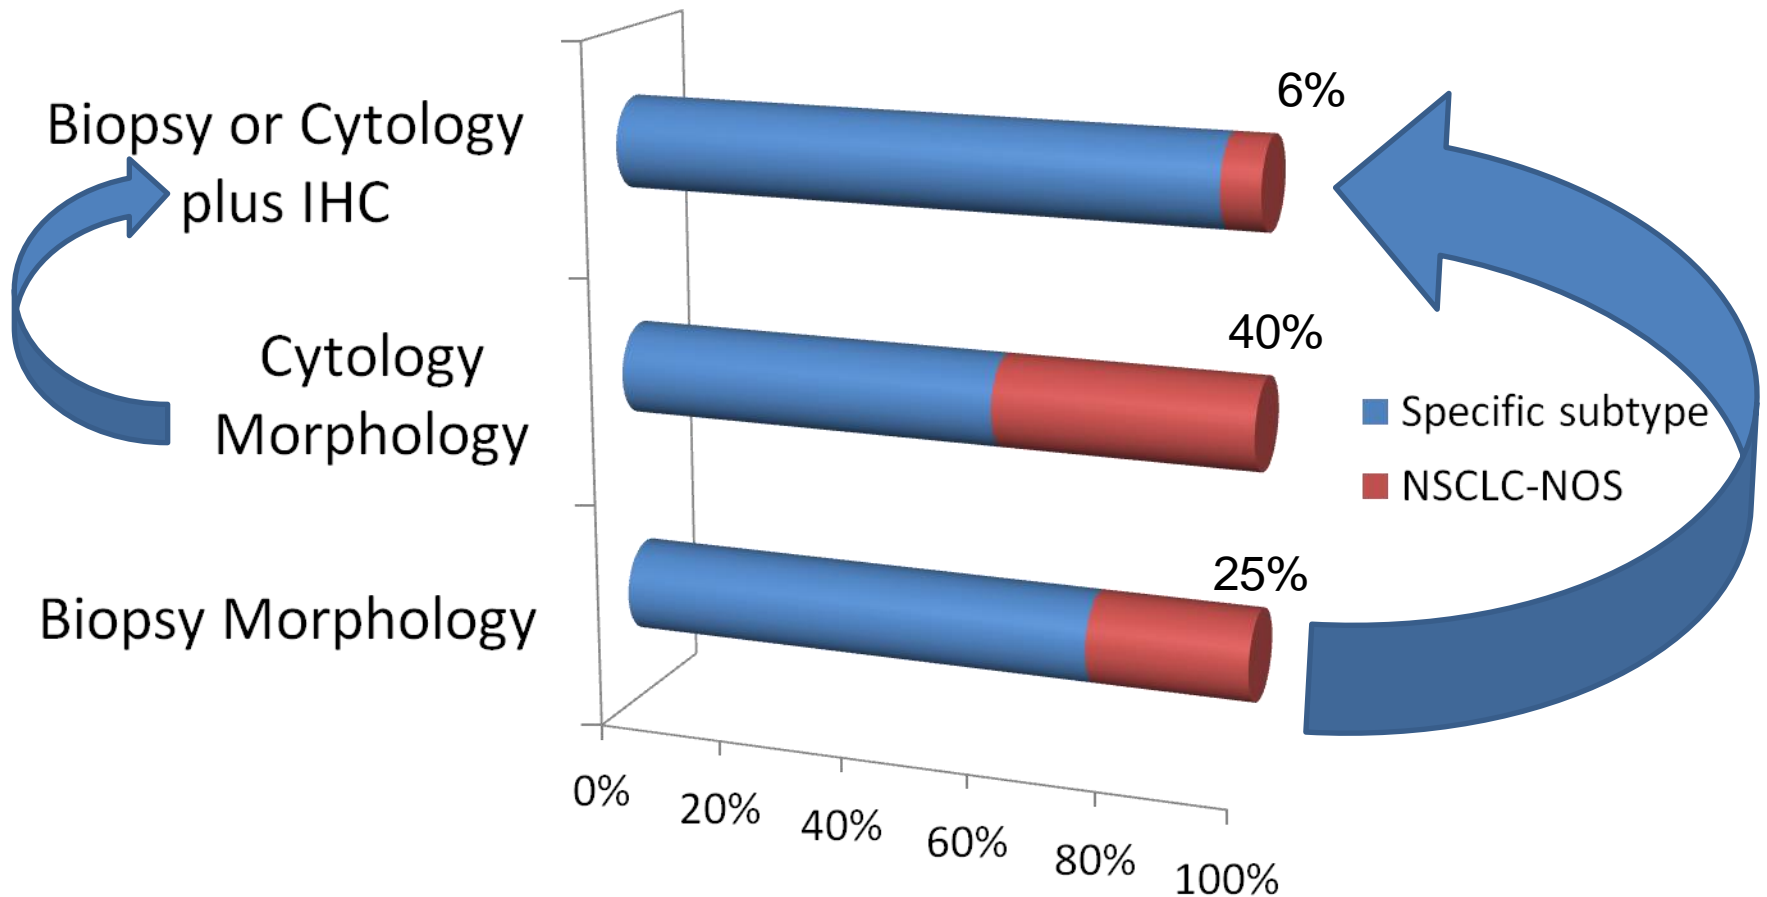

Squamous Cell Carcinoma

Adenocarcinoma

# Subtyping NSCLC: How good?

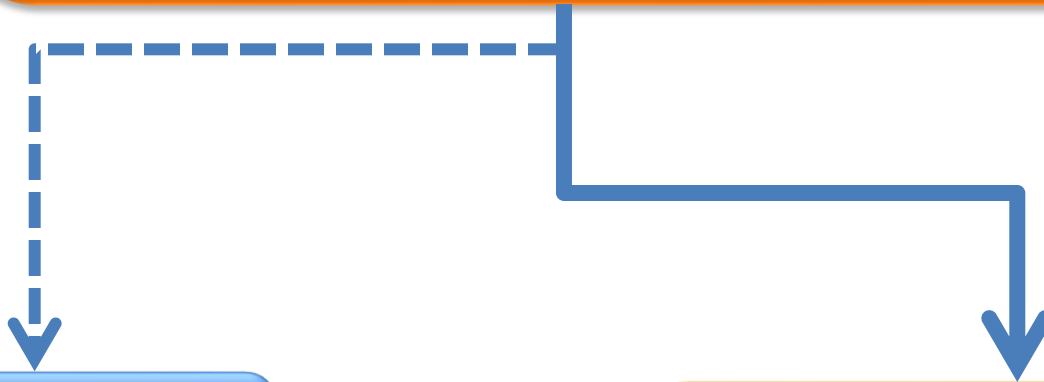

- Predictive IHC has 'levelled the playing field'
- Better diagnosis possible on poorer specimens

# Morphological diagnosis in advanced NSCLC

- Squamous cell carcinoma
- NSCLC, probably squamous cell (IHC)
- Adenocarcinoma
- NSCLC, probably adenocarcinoma (IHC)
- NSCLC-NOS – cannot be resolved (null IHC)
  - Sarcomatoid features?
- Other specific type (carcinoid tumour, etc.)

**Molecular Pathology in appropriate cases (histology-determined) to identify targetable genetic alterations**

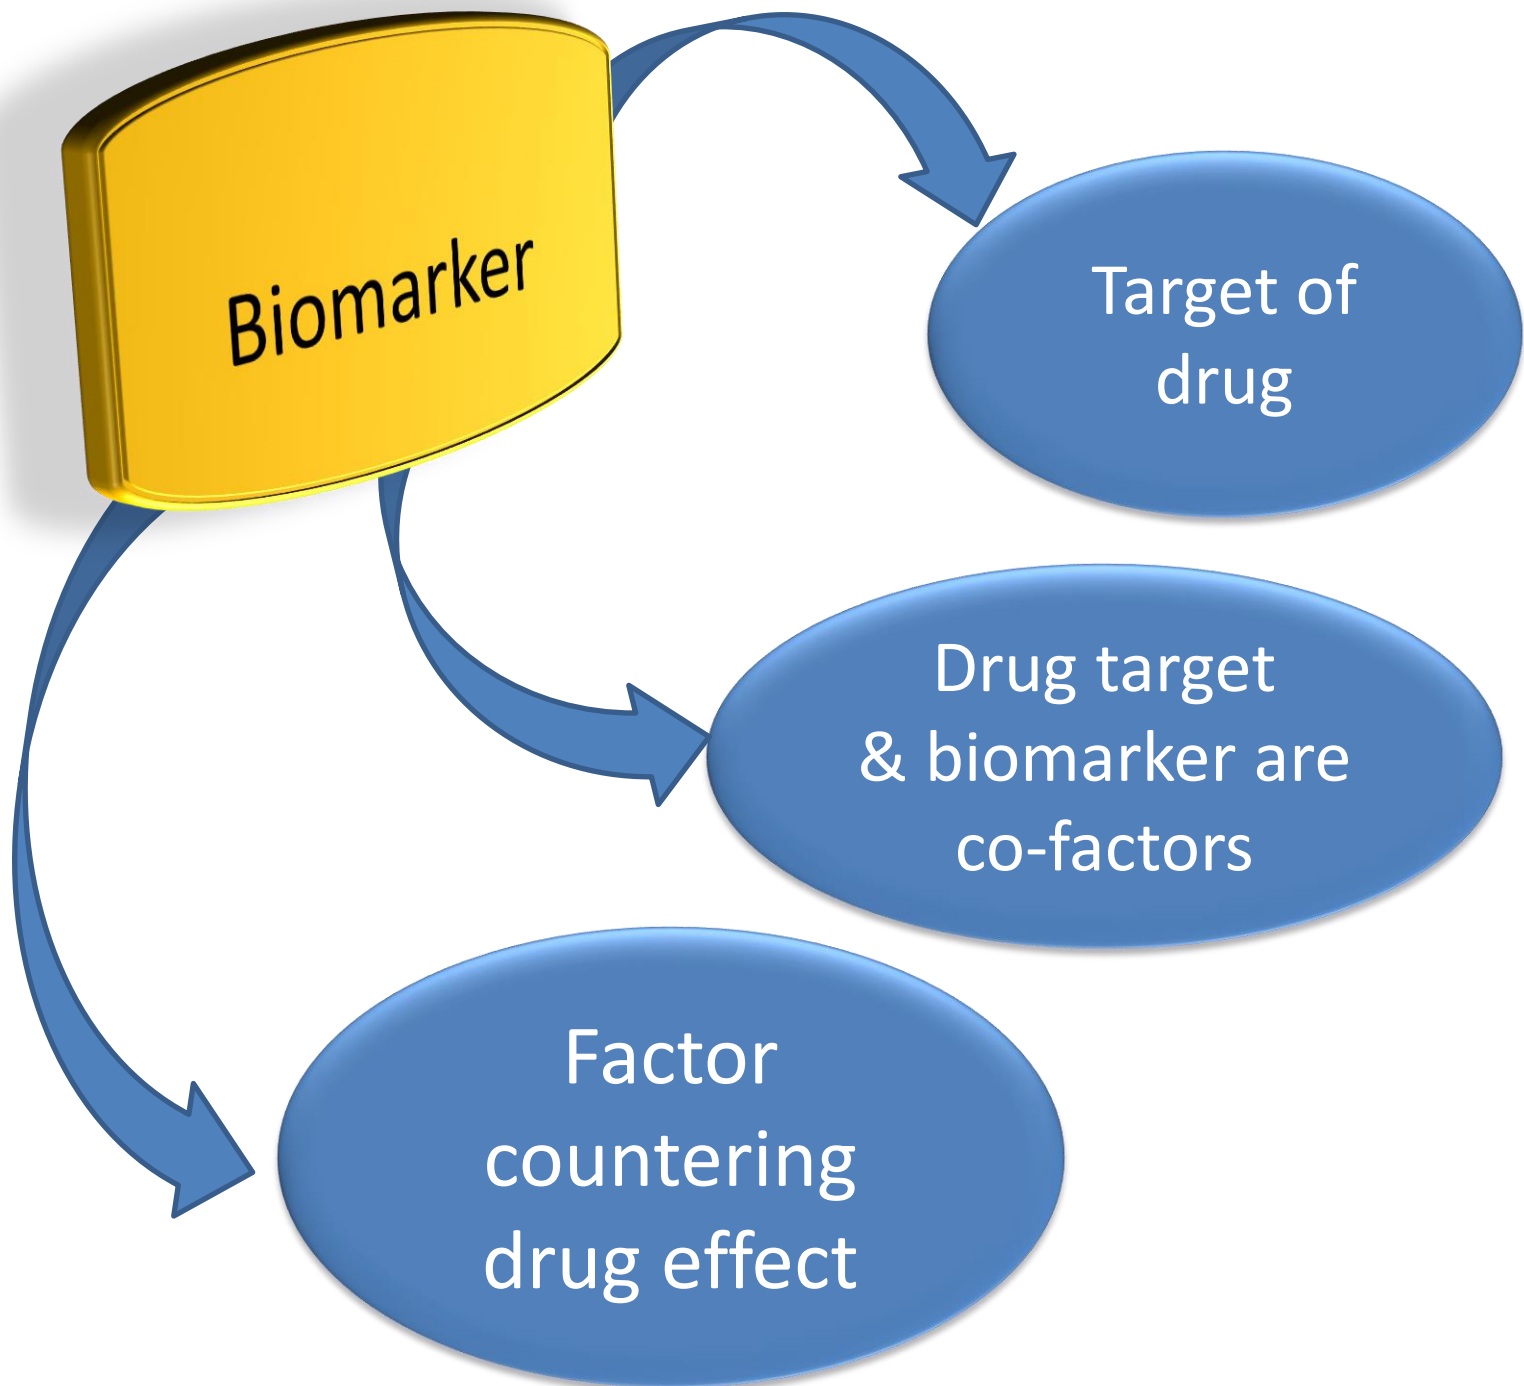

**Prognostic  
Factors ?**

**Adjuvant therapy**

**Predictive  
Biomarkers?**

**Advanced disease**

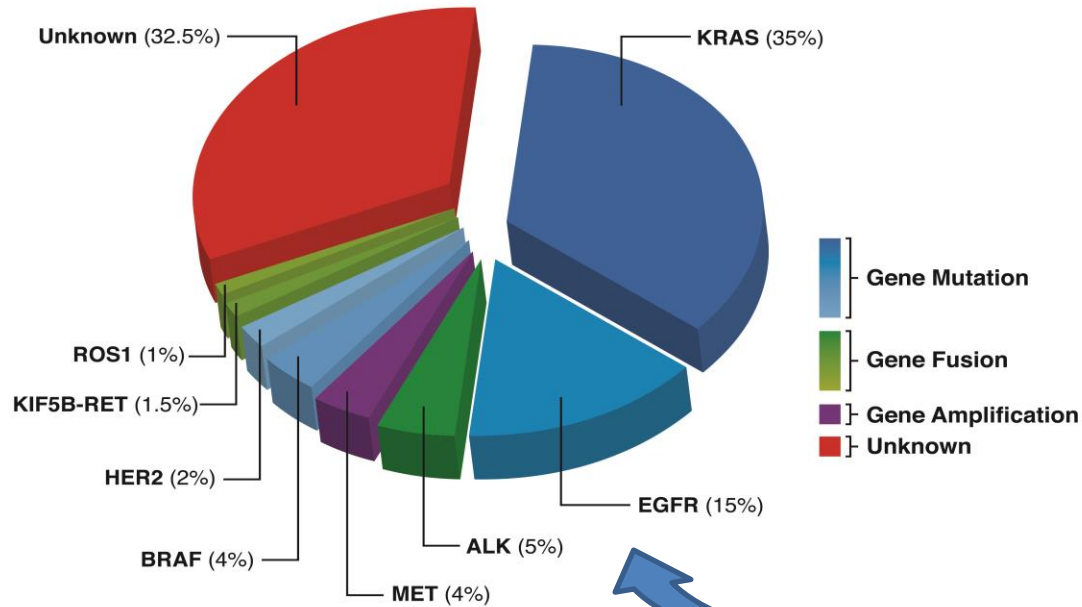

There are MANY **potential**  
biomarkers in lung cancer but.....

# In clinical practice.....

- **EGFR mutation testing**
  - EGFR tyrosine kinase inhibitors
- **ALK gene rearrangement testing**
  - ALK tyrosine kinase inhibitors

# Oncogene 'drivers' in Adenocarcinoma

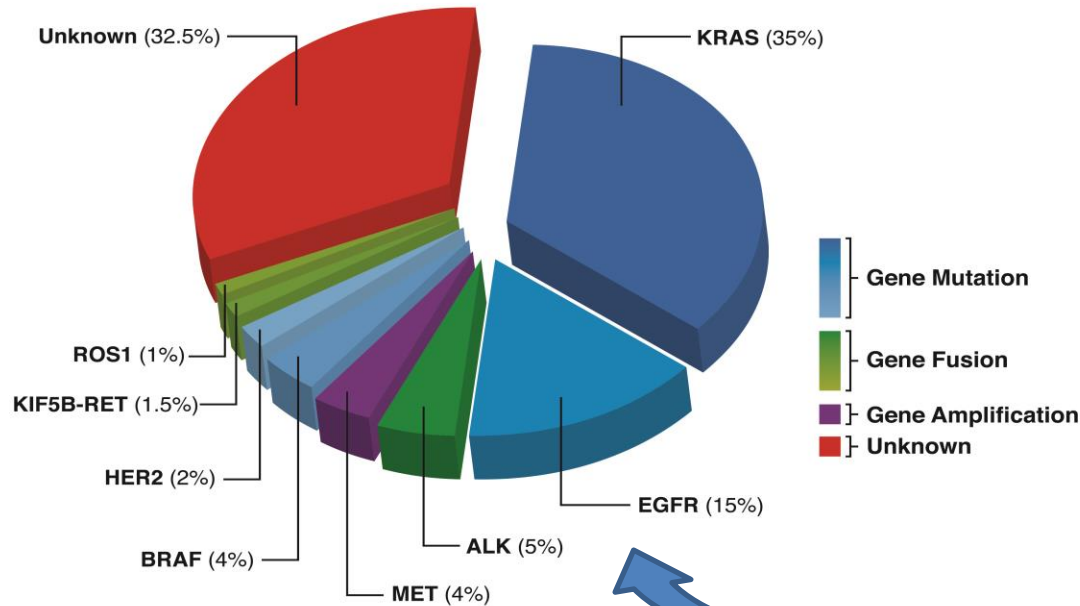

Some are additive oncogenes  
Some are mutually exclusive  
Some are good drug targets

EGFR mutation and ALK fusion  
20% of adenocarcinomas

Kerr KM. J Clin Pathol 2013;66:832–838

## Oncogene 'drivers' in Adenocarcinoma

Some are additive oncogenes  
Some are mutually exclusive  
Some are good drug targets

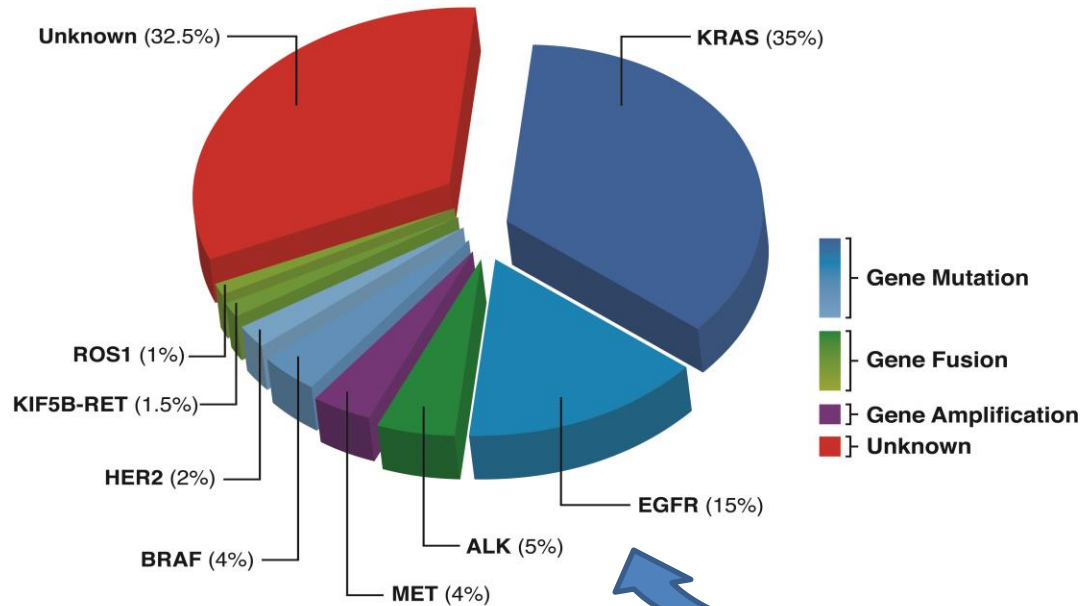

EGFR mutation and ALK fusion  
20% of adenocarcinomas

Kerr KM. J Clin Pathol 2013;66:832–838

### So we should test

- Adenocarcinomas
- Probably adenocarcinomas
- 'cannot exclude adenocarcinoma'
- Partly adenocarcinoma

## Oncogene 'drivers' in Adenocarcinoma

Some are additive oncogenes  
Some are mutually exclusive  
Some are good drug targets

EGFR mutation and ALK fusion  
20% of adenocarcinomas

Kerr KM. J Clin Pathol 2013;66:832–838

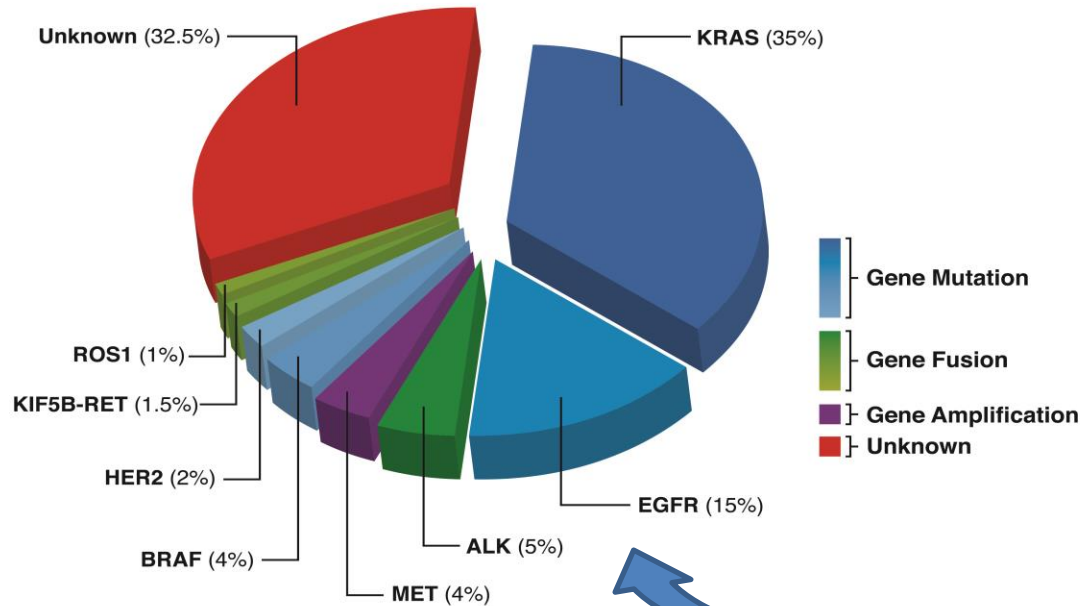

### So we should test

- Adenocarcinomas
- Probably adenocarcinomas
- 'cannot exclude adenocarcinoma'
- Partly adenocarcinoma

### And we should test

- Smokers
- Males
- Any ethnic group

## Oncogene 'drivers' in Adenocarcinoma

Some are additive oncogenes  
Some are mutually exclusive  
Some are good drug targets

EGFR mutation and ALK fusion  
20% of adenocarcinomas

Kerr KM. J Clin Pathol 2013;66:832–838

### So we should test

- Adenocarcinomas
- Probably adenocarcinomas
- 'cannot exclude adenocarcinoma'
- Partly adenocarcinoma

### And we should test

- Smokers
- Males
- Any ethnic group
- Any tumour in a never smoker
  - Or long time ex-smoker.....

# Who orders the test?

## Reflex versus Bespoke testing

### Reflex – pathologist driven

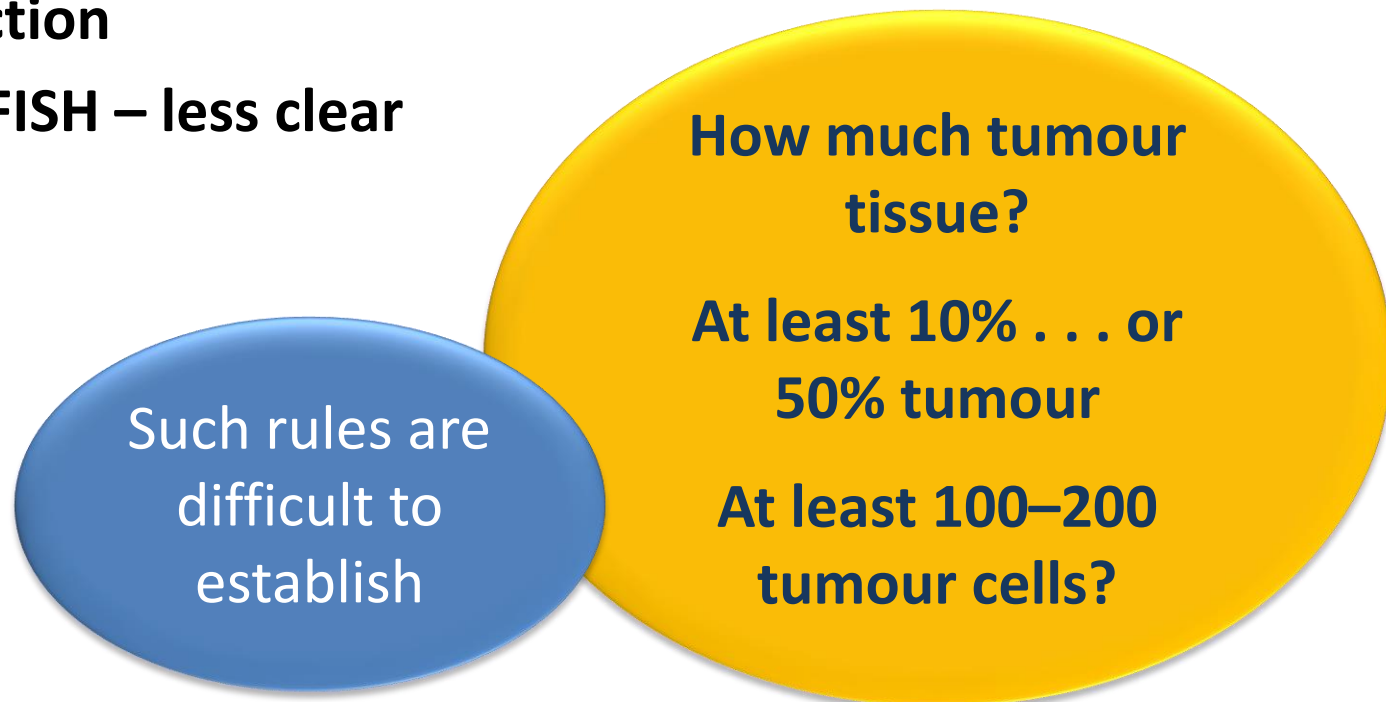

- Fast
- Cases not missed, becomes 'routine'
- Ready for tumour board decision
- *Potential for waste*
  - Time
  - Tissue
  - Money

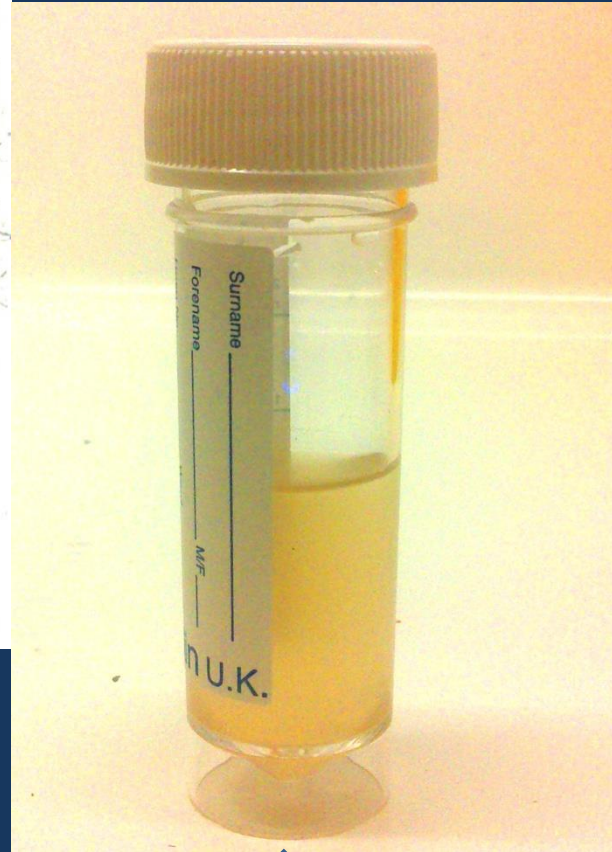

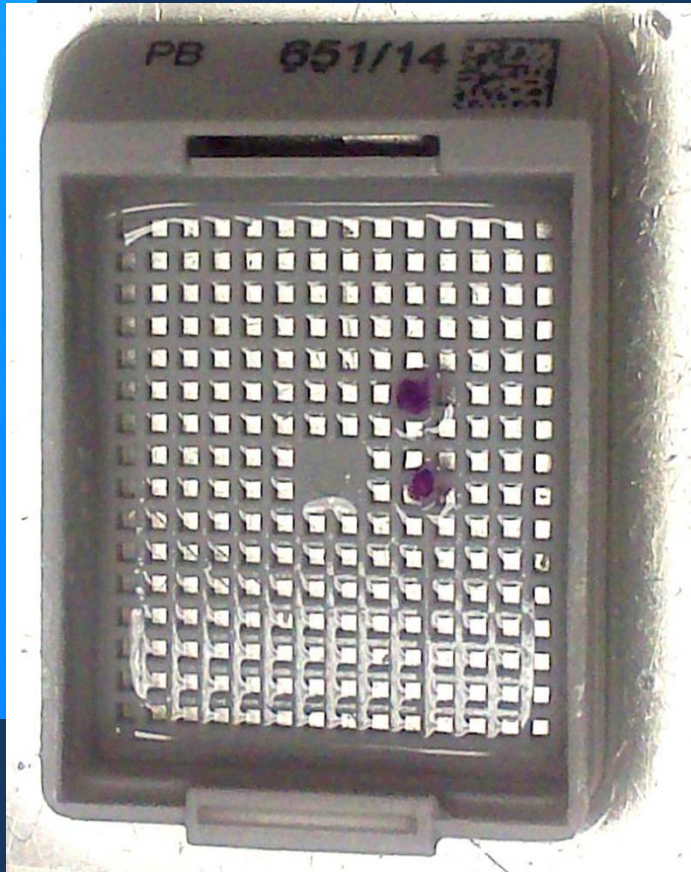

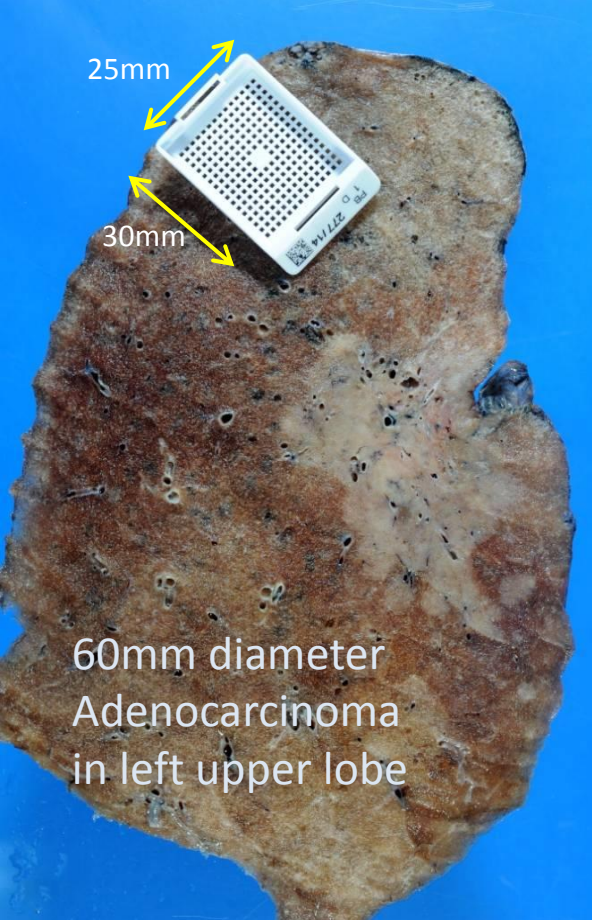

### Bespoke – to order from oncologist

- Only when needed
- Preserves tissue
- Lab time not wasted?
- *'Cost' higher per test*
- *Slower turnaround*
- *Could be illogical; cases may be missed*

# What do we use for the test?

- Whatever is available – **we need tumour cells!!!**
- Tissue or Cytology Cell block sections
  - **Maximise tumour cells in material submitted for DNA extraction**
  - **Minimise non-tumour cells in material submitted for DNA extraction**
  - **For IHC or FISH – less clear**

Most Lung Cancer **samples** are  
small biopsies or cytology-type samples

# What do we use to test?

	Aberdeen Royal Infirmary, UK*	Aichi Cancer Centre, Nagoya, Japan
Sample type	Percentage of cases submitted	
Surgical Tumor Resection	19%	46%
Lung core biopsy	20%	21%
Bronchial biopsy	19%	11%
Pleural biopsy	7.3%	0.7%
Other biopsy types	22%	4.2%
<b>Total Biopsy samples</b>	<b>87.3%</b>	<b>82.9%</b>
Aspiration cytology	6.5%	9.3%
Pleural fluid cytology	5.0%	6.6%
Bronchial cytology	1.2%	1.2%
<b>Total Cytology samples</b>	<b>12.7%</b> 	<b>17.1%</b>

2010 data: In Aberdeen Cytology type samples now ~50% of those tested

a

b

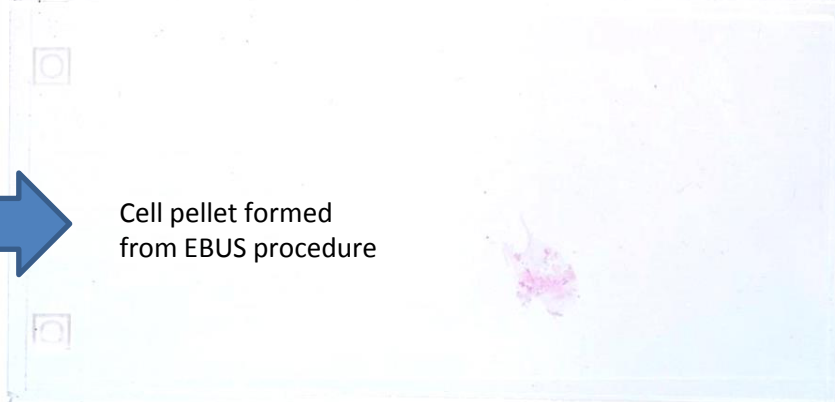

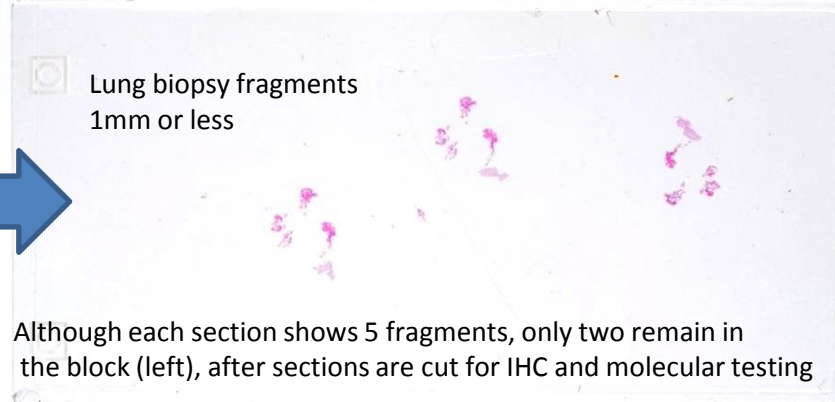

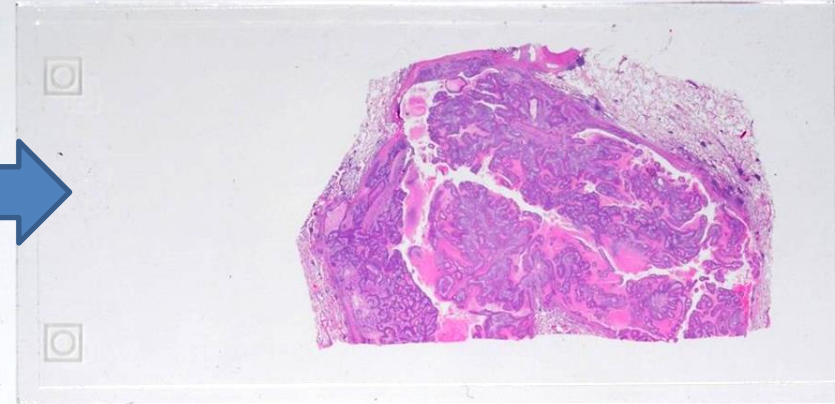

c

The plastic cassettes used for processing tissue are also used to support the paraffin wax embedded block

Abundant tumour tissue in a block taken from a resected tumour

Lung biopsy fragments  
1mm or less

Although each section shows 5 fragments, only two remain in the block (left), after sections are cut for IHC and molecular testing

Cell pellet formed  
from EBUS procedure

Sections cut from the block, mounted on glass slide and stained with Haematoxylin and eosin (H&E)

# Is there enough material for these studies?

Two biopsy fragments <1mm

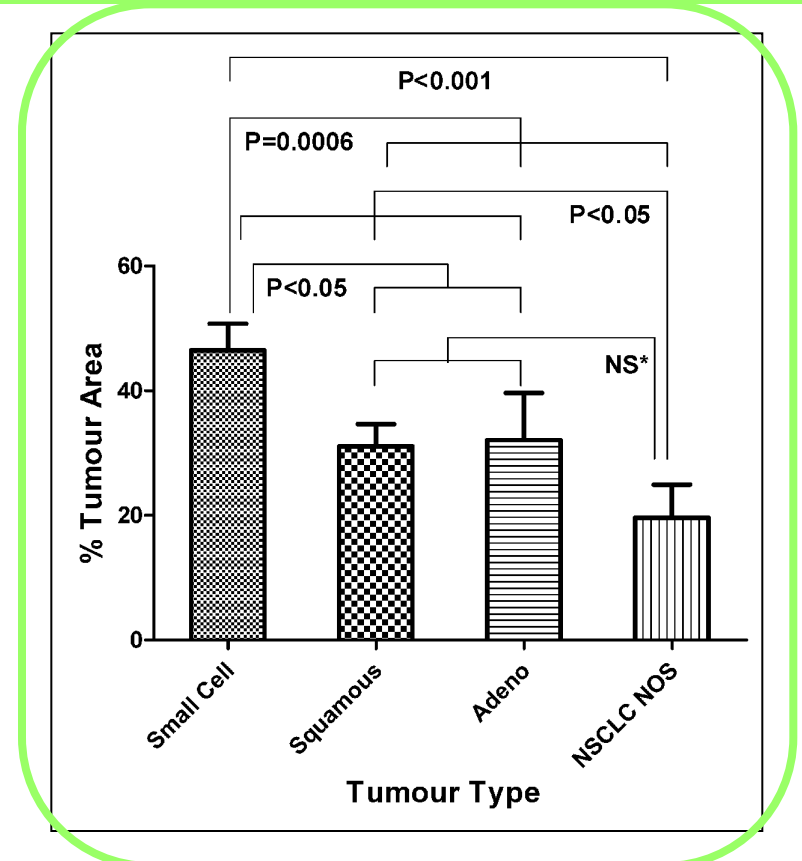

- **Morphologic diagnosis**
- **Immunohistochemistry**
- **Molecular testing**
- **Conserve tissue**
- **Don't waste**

# Is there enough material for these studies?

Two biopsy fragments <1mm

## % tumour in bronchial biopsy samples

In 'malignant' bronchial biopsy samples  
33-50% of fragments do not contain tumour

The figure consists of three vertically stacked panels of fluorescence microscopy images. Each panel shows a field of cells with blue-stained nuclei. Small, bright green and red fluorescent spots are visible within the nuclei, representing specific genetic markers or proteins. The top panel shows a sparse distribution of these spots. The middle panel shows a higher density of spots. The bottom panel shows a very high density of spots, with many nuclei appearing to be filled with them.

# Amplification

# Pathological assessment for molecular testing

- There is tumour present
- It has been prepared in an appropriate way
  - Fixation window 6-48hrs.....
- There is enough tumour?
- The molecular lab knows what it is getting?
  - % tumour in extraction sample
  - Tumour cell number?

Ventana  
'Kit'**

**Borderline**

**Positive**

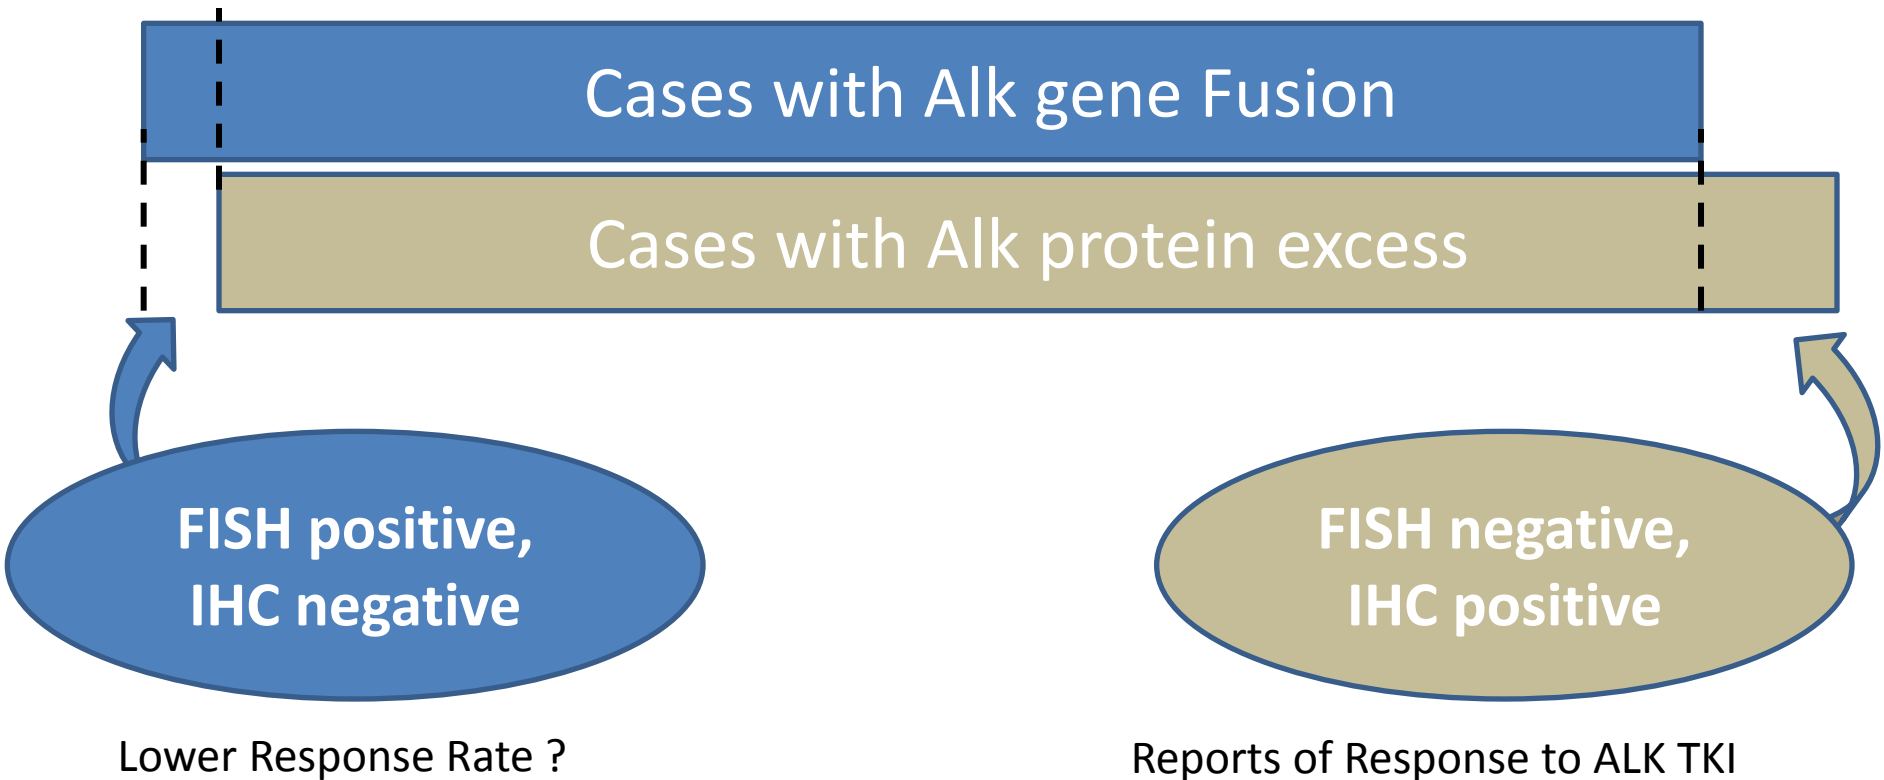

**FISHTest?**

**Almost 100%  
NEGATIVE**

**Variable:  
Majority Negative**

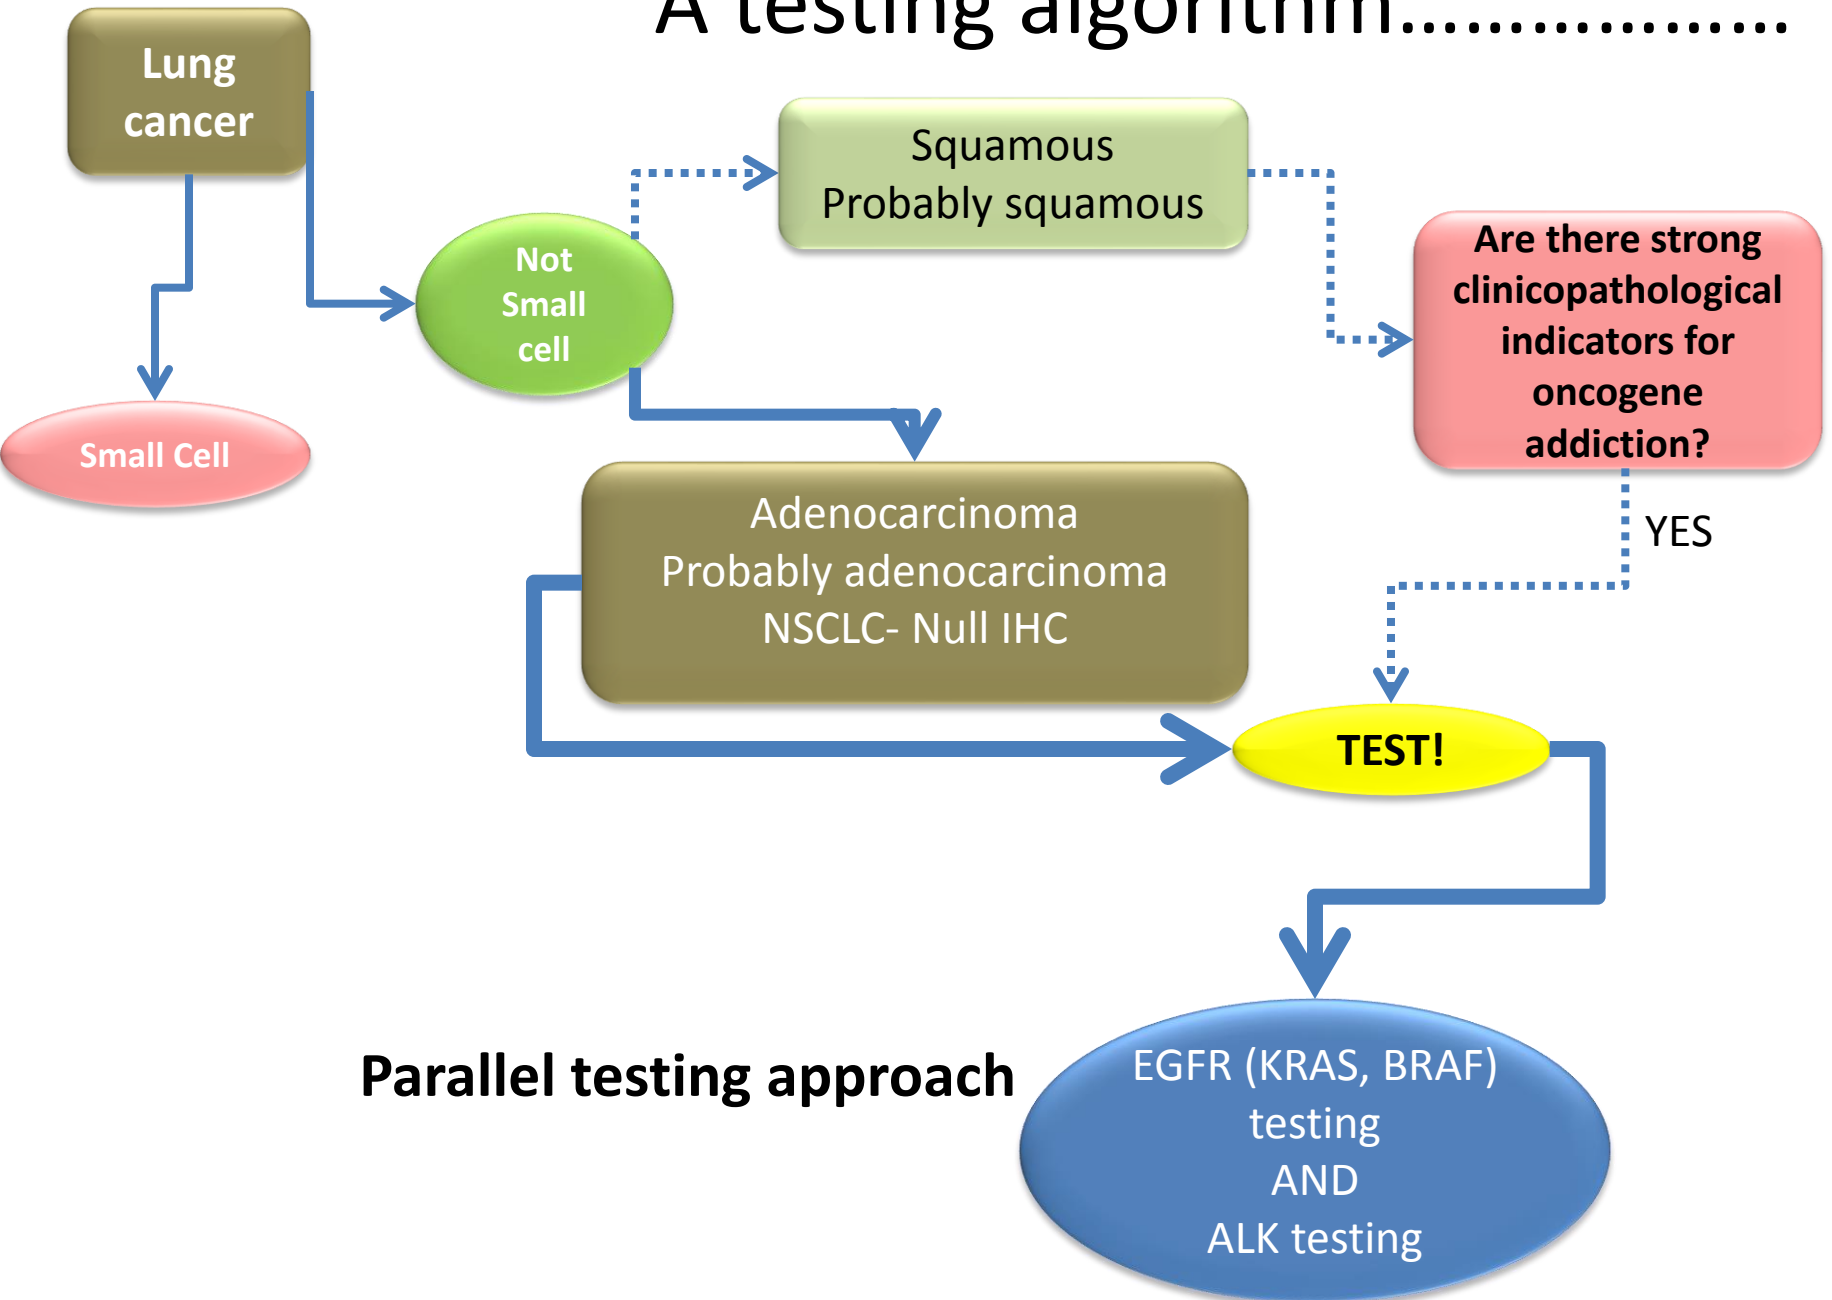

**Almost 100%  
POSITIVE**

The protein does the job  
The protein is the target of the drug

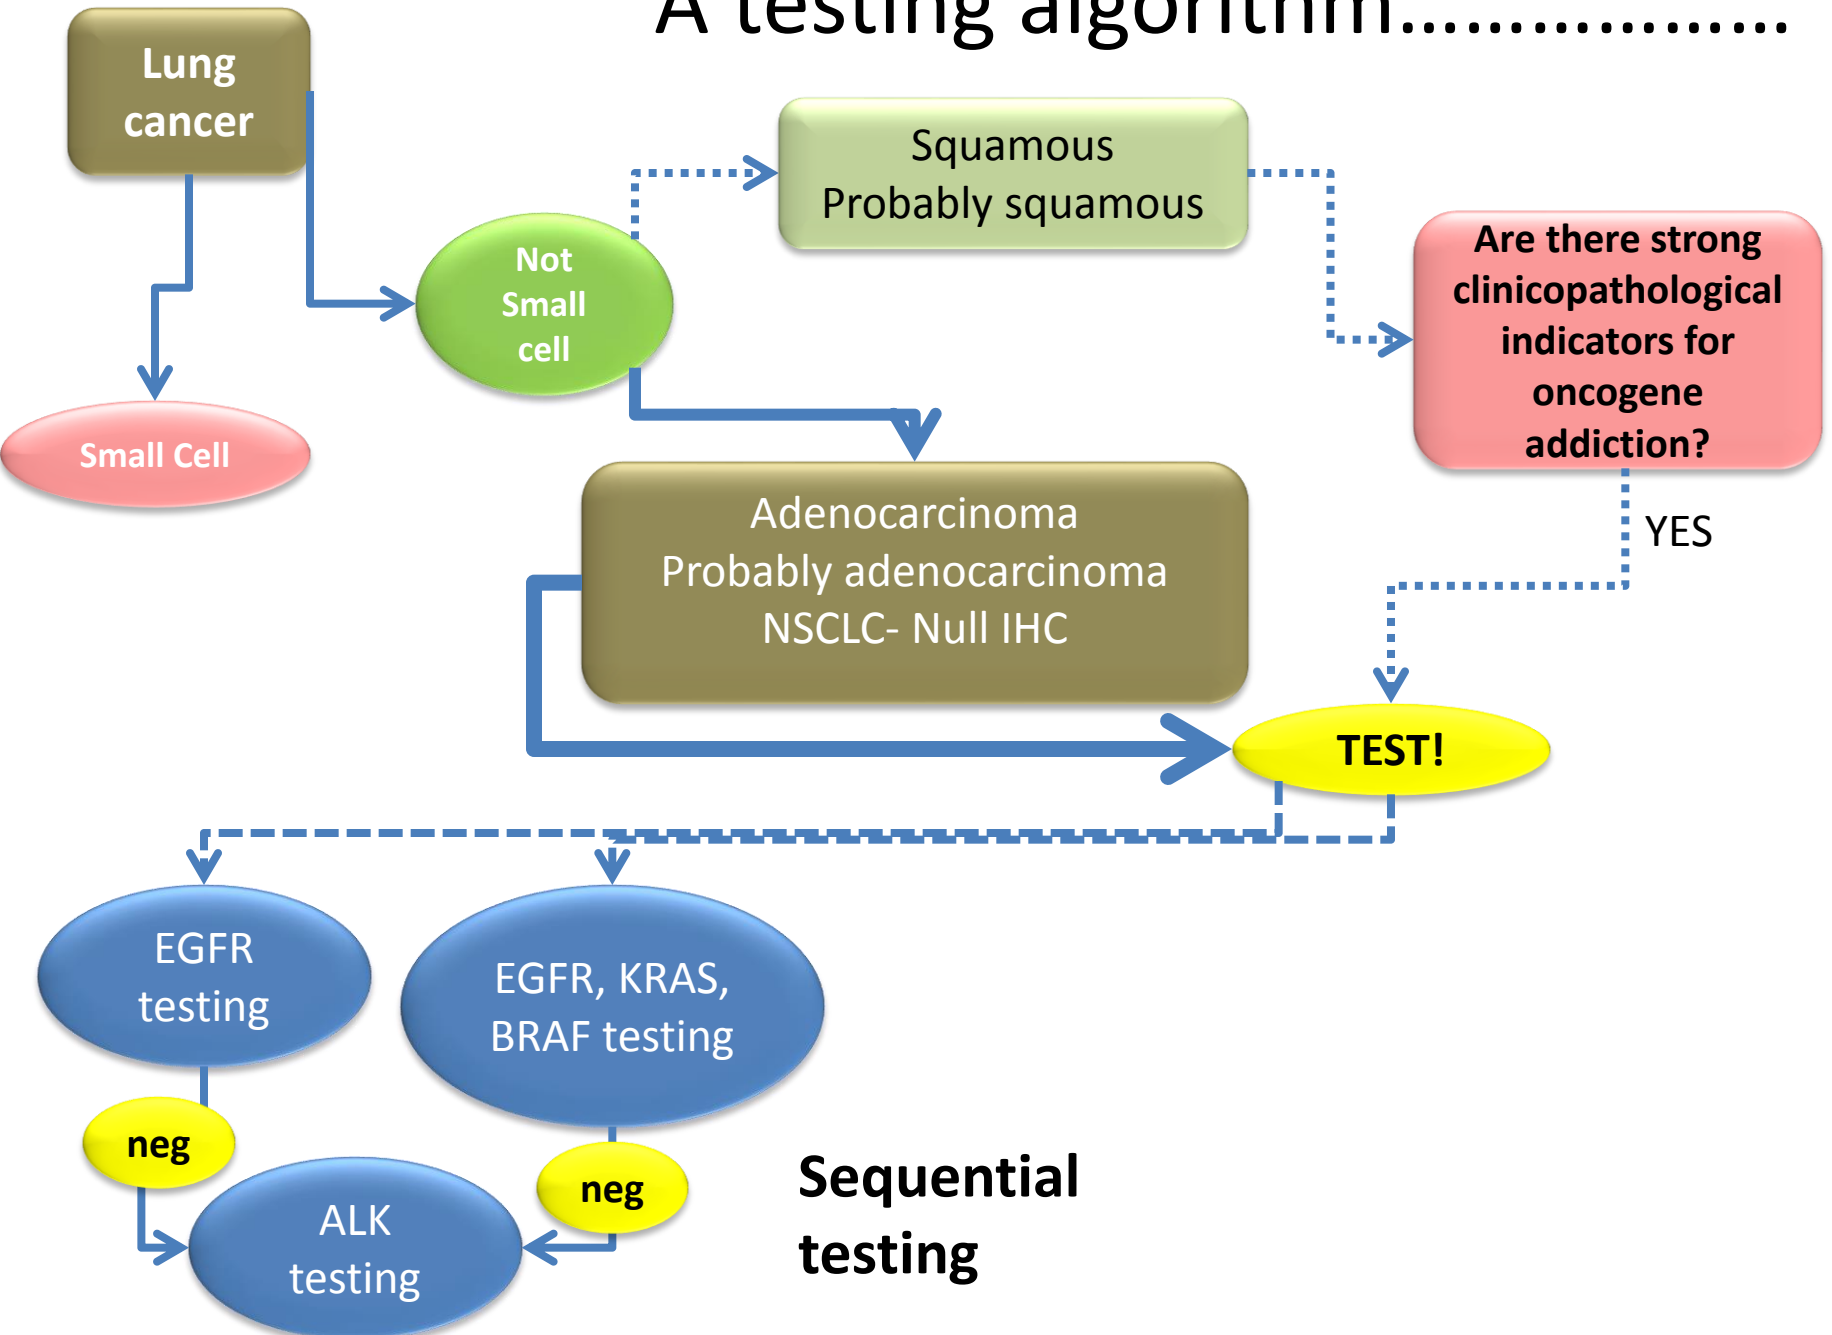

**Role of Multiplex PCR in 'discrepant cases'?**

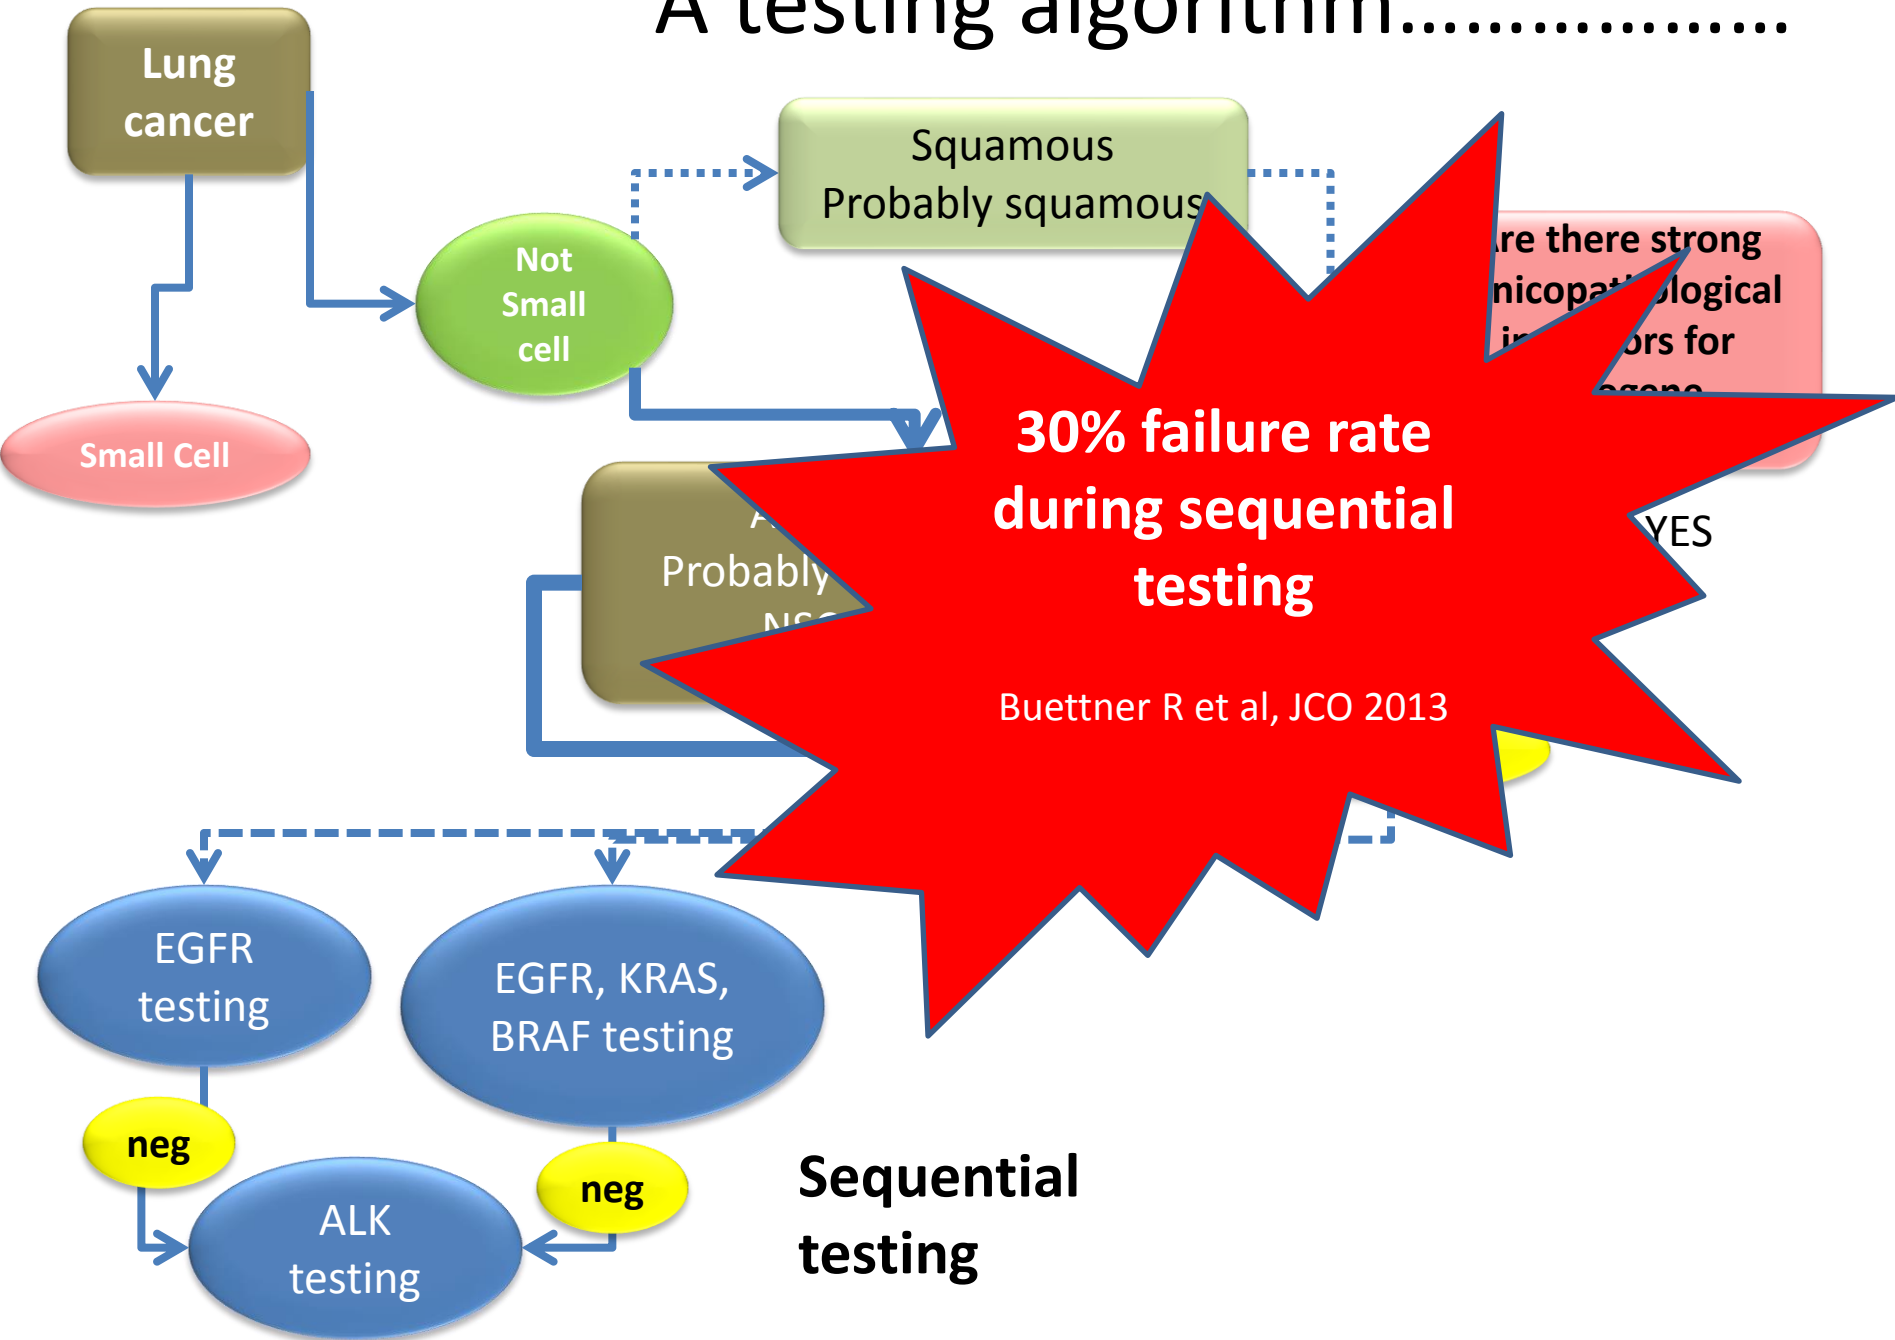

# A testing algorithm.....

# A testing algorithm.....

# A testing algorithm.....

# Do we always succeed?

- Diagnostic IHC – rarely insufficient
  - Occasionally it just doesn't work!
- EGFR mutation
- ALK rearrangement
  - IHC screening
  - Confirmation by FISH

# Experience from Clinical Trials

## **Battle Trial** Tam AL et al. J Thorac Oncol 2013;8:436

- **20g needle core biopsies**
- 3 PCR sequencing targets
- Two FISH tests
- 6 IHC markers
- **83% adequate for full set**

## **EURTAC** Benlloch et al. J Clin Oncol 2012;30:s10596

- **70% Bronchial biopsy**
- 15% blocks insufficient for EGFR.
- Additional 3% - PCR failure
- Testing 'beyond EGFR' not possible in 47% as block exhausted

## **MSKCC Squamous** Paik et al. J Clin Oncol 2012;30, s7505

- **72% Core biopsy 11% FNAC**
- **17% Resections**
- Sequenom, 1 FISH, 1 IHC test
- **87% complete full set**
- **8% partial set**

## **IPASS** Yang JC et al Lung Cancer 2014; 83, 174-181

- **Initially rejected samples (<100 cells)**
- 99 histology cases – **80% success**
- 116 cytology cases – **19% success**
- Positives clinically responded

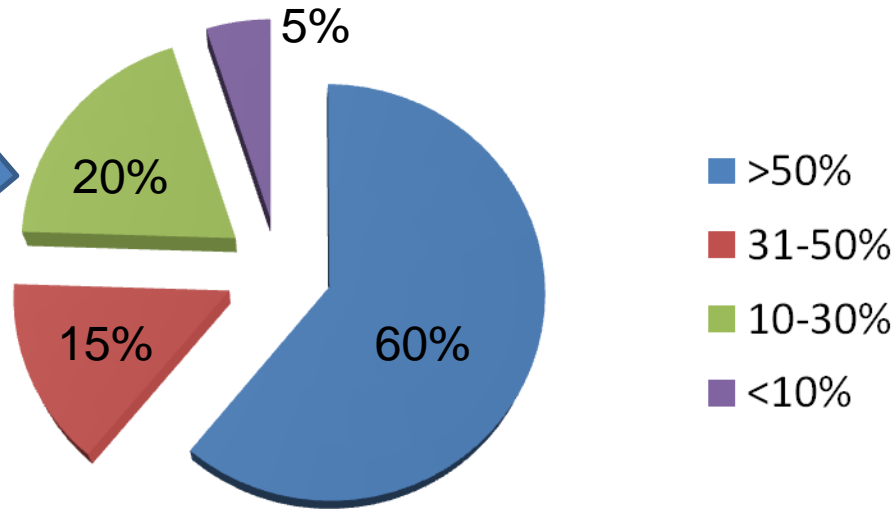

# EBUS samples: How do they go?

- 434 malignant samples
  - 70% specific cell type, 30% NSCLC-NOS
    - Navani N et al, AJRCCM 2012

Ref	% EBUS INSUFF for EGFR mutation test	Comment
GarciaOlivia et al 2010	28%	12% for core biopsy
Schuurbiers et al JTO 2010	23%	
Esterbrook et al, Lung Cancer 2013	12%	Cell block based
Navani et al, AJRCCM 2012	10%	
Rekhtman et al, JTO 2011	2%	

# Molecular Pathology, Aberdeen Royal Infirmary

Tumour cells in samples

Cytology samples  
over-represented in this group

- **EGFR, KRAS, BRAF**
- **For EGFR alone**
  - 1.63% total fail rate
  - 3.3% partial fail
- **In 'POOR' cases**
  - 6.5% total fail rate
  - 6.5% partial fail
- **Huge range with 'outside' cases (up to 35%)**

# Alk testing 'success'??

- In Aberdeen
  - About 4% of cases insufficient for ALK IHC
  - About 10% cases insufficient for ALK FISH
    - 50-60 assessable cells
    - 4 high power fields to assess
- Up to 20% of samples may be 'insufficient' for ALK FISH testing
  - Lantuejoul S et al in IASLC ALK Atlas

# Strategy to Preserve Tissue

- It is still necessary to make the best diagnosis possible!
- The NSCLC-NOS issue
  - Use the minimum amount of extra material
  - Antibody cocktails – double staining?
- Do not chase ‘phantom’ metastatic disease
- Process all ‘fluids’ if possible
- Reflex section cutting?

# EGFR mutation testing: what do the results mean?

## Is the result 'real'?

- **False negatives**
  - Real risk
  - Poor samples
  - Pre-analyticals
  - Sample preparation
  - Insensitive analysis
  - Heterogeneity
- **False positives**
  - More dangerous?
  - Poor testing methodology
  - Artefacts
  - Contamination
- ❖ **Test failures**
  - ❖ Not enough DNA
  - ❖ PCR failure
  - ❖ Test failure
  - ❖ Partial results

# Other potential lung cancer biomarkers

Apoptosis pathways  
Drug targets – TS  
Modifiers – RRM1

# NGS for molecular testing

- Quoted amounts of DNA required rather variable
  - Technology dependant
  - Size of panel
- Mutation > Fusion gene > gene copy number
- Fragmentation of DNA
- Bioinformatic analysis
- 80% samples – complete panel of mutations
- 95% samples – EGFR, KRAS, BRAF, HER2 mutations
- ‘minimum 2000 cells’ - 5 x 10um thick sections

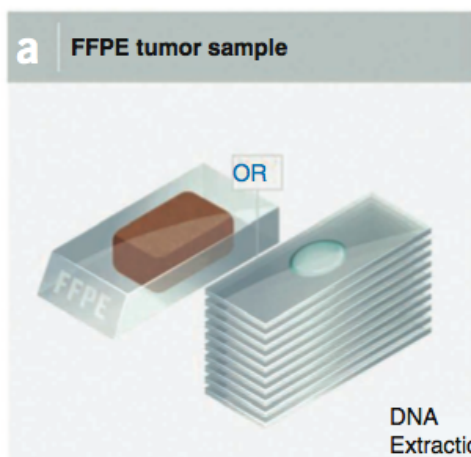

Myerson M et al. Nat Rev Gen 2010

- **Much still to define**

- False-negative calls were predominantly low ( $<10\%$ ) mutant allele frequencies substitutions, indels or low-magnitude copy number alterations.
- **Comprehensive genomic profiling was successful for 95% of clinical cases**

Frampton G, *et al.* Nature Biotechnology 2013; Epub ahead of print.

**Sample requirements**

- Surface area:  $\geq 25 \text{ mm}^2$
- Sample volume:  $\geq 1 \text{ mm}^3$
- Nucleated cellularity:  $\geq 80\%$   
or  $\geq 30,000$  cells
- Tumor content:  $\geq 20\%$

Fraction of patients with tissue  
insufficient for analysis: 10–15%

More than 25mmsq = 5 x 5mm area

1mm cube of tumour

Cellularity  $> 80\%$  or  $> 30,000$  cells

Tumour content  $> 20\%$  - 1500 tumour  
cells

10 -15% insufficient for analysis

- False-negative calls were predominantly low ( $< 10\%$ ) mutant allele frequencies substitutions, indels or low-magnitude copy number alterations.
- **Comprehensive genomic profiling was successful for 95% of clinical cases**

Frampton G, *et al.* Nature Biotechnology 2013; Epub ahead of print.

# Consensus for *EGFR* Mutation Testing in Non-small Cell Lung Cancer

*Results from a European Workshop*

Pirker R et al. JTO 2010

**TABLE 1. Biopsy Techniques**

	<b>21-g Needle Aspiration</b>	<b>19-g Needle Aspiration</b>	<b>Transbronchial Biopsy</b>	<b>CT-Guided Needle Biopsy</b>
Total no. of cells per biopsy/ aspiration	$\geq 100$	$\geq 150$	$\geq 300$	$\geq 500$
No. of biopsies	4	4	4–5	2–3

400 -600 cells

~1500 cells

# Success in Biomarker testing?

- Be aware! Anticipate testing.....
- Maximize tissue collection – do no harm
- Process tissue appropriately
- ANY SAMPLE TYPE is *potentially* adequate for biomarker testing
- Take steps to ‘improve’ the test sample
- Quality-assured molecular testing
- Plan your testing strategy
  - This is a MULTIDISCIPLINARY effort
- Everyone on the team UNDERSTANDS WHY testing is important
- Communication, communication, communication.....

# Molecular Testing Guideline for Selection of Lung Cancer Patients for EGFR and ALK Tyrosine Kinase Inhibitors

*Guideline from the College of American Pathologists, International Association for the Study of Lung Cancer, and Association for Molecular Pathology*

Quality control by pathologist :

- Fixation : 6-12 hrs 10% neutral-buffered formalin
- Estimate the **cellular tumour content and tumour purity**

**Ideally :**

high proportion (**>30-50%**) of malignants cells relative to nonneoplastic cells  
+  
minimal proportion (**<20%**) of substances that may inhibit amplification  
(e.g. necrosis, mucin)

Number of cells?

Lindeman et al. J Thorac Oncol 2013;8:823-59.
