GENERAL RULES FOR PATHOLOGISTS WHEN DIAGNOSING MESOTHELIOMA

- Adequate tissue
 - large surgical specimens (core biopsies, pleural peel)
- Correlation with radiographic and intraoperative findings
- A history of asbestos exposure should not be taken into consideration
- Perform appropriate immunohistochemistry

15-18 April 2015, Geneva, Switzerland

IMMUNOHISTOCHEMISTRY MESOTHELIAL HYPERPLASIA VS. MESOTHELIOMA

“ In the individual case, immunohistochemical staining reactions are simply too variable to be relied upon, and we do not recommend their use.”

CYTOLOGIC DIAGNOSIS OF MESOTHELIOMA

- High false–negative rate (sensitivity 32% -76%)
- Sarcomatoid mesotheliomas do not shed into the effusion fluid
- FISH for *p16* deletion can be helpful

SUMMARY

- Diagnosis of malignant mesothelioma requires multidisciplinary approach
- Sarcomatoid mesotheliomas and distinction from benign mesothelial proliferations are challenging diagnostic areas
- FISH for 9p21 (*p16*) deletion may be diagnostically helpful, although it has a low sensitivity
