#### ESMO 2102. Controversy Session

# Can neo-Adjuvant breast cancer data be used to accelerate drug approval?

# THE PRO VIEW

Jose Baselga, MD, PhD Physician in Chief

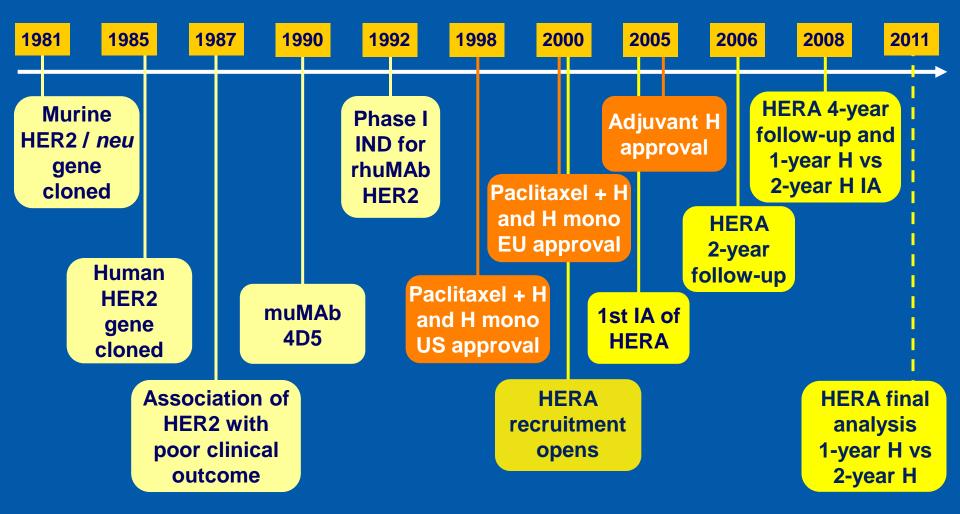

January 1st 2013

- What Ian Tannock is going to tell you:
  - Only survival benefit from randomized phase III adjuvant trials should be used as an endpoint for approval of a new agent.
  - Safety is critical in patients with curable disease
  - Neoadjuvant trials
    - Are too small, too short follow up
    - pCR is not a validated endpoint
    - ER + tumors do not even achieve a pCR
  - He will imply that we stick to the same old approach that the field has championed over many decades

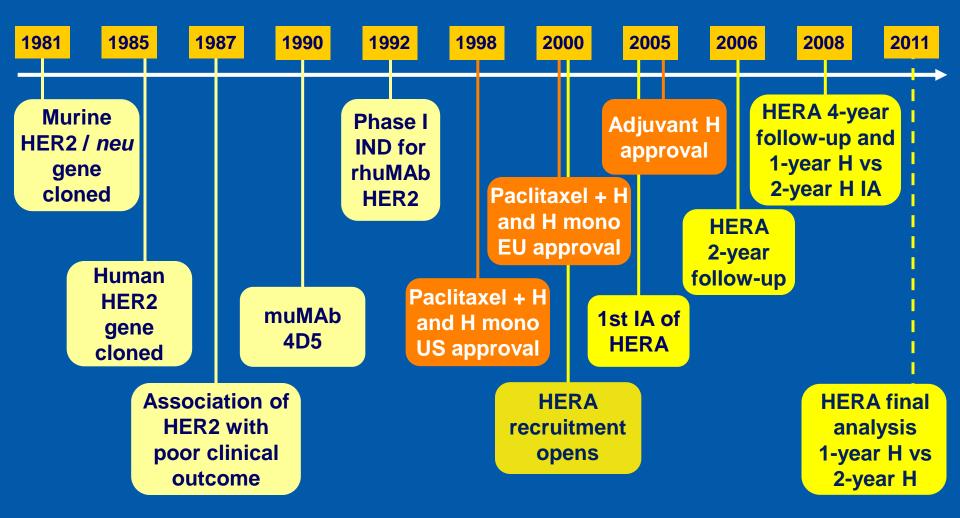

- What Ian Tannock is going to tell you:
  - Only survival benefit from randomized phase III adjuvant trials should be used as an endpoint for approval of a new agent. WRONG
  - Safety is critical in patients with curable disease.
    WE AGREE, NEOADJUVANT TRIALS DO THIS
  - Neoadjuvant trials
    - Are too small, too short follow up. WRONG
    - pCR is not a validated endpoint. WRONG
    - ER + tumors with hormone Rx do not even achieve a pCR. WRONG AGAIN. WE DO NOT measure pCR in ER+ DISEASE

#### The fascinating history of Trastuzumab

HER2, human epidermal growth factor receptor 2; H, Herceptin; IA, interim analysis

# The SLOW history of Trastuzumab

HER2, human epidermal growth factor receptor 2; H, Herceptin; IA, interim analysis

#### What Have We Learned? Targeted therapies require new types of clinical trials

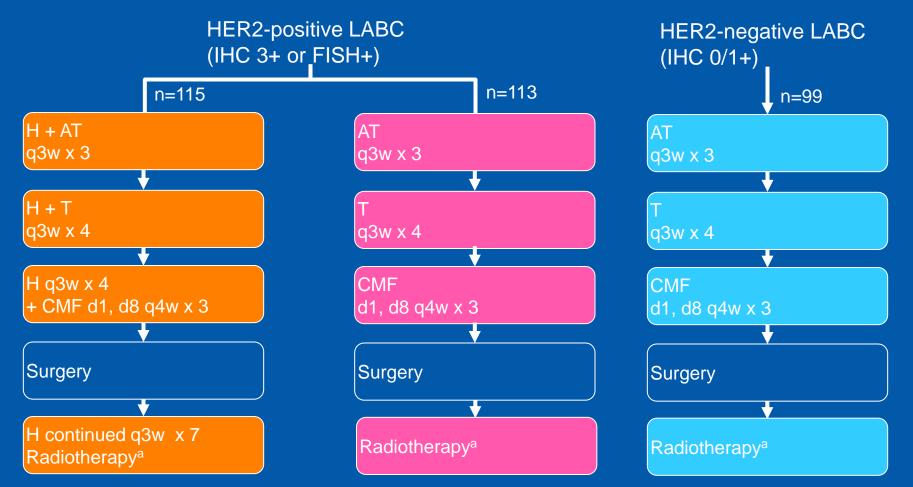

To realize the full benefits of targeted cancer therapies we need . . .

- Early clinical trials--enrolling some patients at diagnosis
- Smaller clinical trials
- Combinatorial (multi-drug) trials

# Neoadjuvant (Primary) Therapy in Breast Ca. Advantages

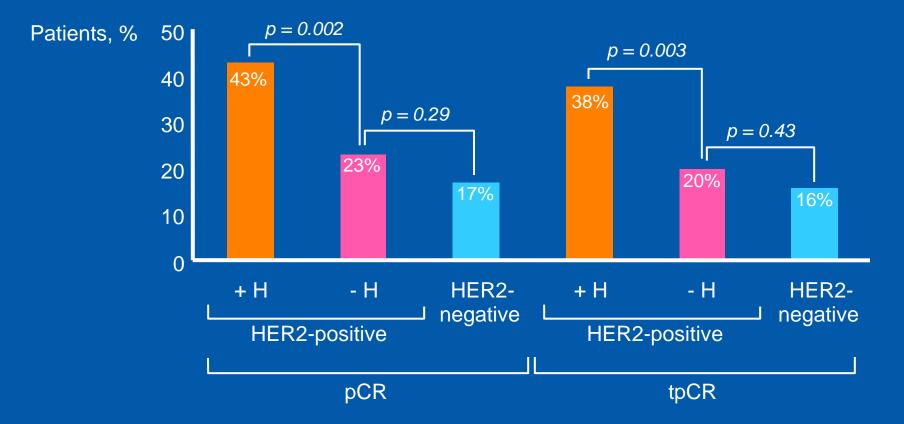

- Improves rate of breast-conservation therapy for localized breast cancer.
- Allows assessment of tumor response to systemic therapy.
- Facilitates identification of predictive biomarkers.
- Provides an efficient trial design for assessment of efficacy of novel therapies utilizing pCR (pathological complete remission) as a surrogate marker for disease free-survival and overall survival.
  - Faster
  - Smaller sample size
  - Reduced cost

# Neoadjuvant Trastuzumab (NOAH)

LABC, locally advanced breast cancer; HER2, human epidermal growth factor receptor 2; IHC, immunohistochemistry; FISH, fluorescence *in situ* hybridisation; A, doxorubicin (60 mg/m<sup>2</sup>); H, Herceptin (8 mg/kg loading, then 6 mg/kg); T, paclitaxel (150 mg/m<sup>2</sup>); CMF, cyclophosphamide (600 mg/m<sup>2</sup>)/methotrexate (40 mg/m<sup>2</sup>)/5-fluorouracil (600 mg/m<sup>2</sup>); <sup>a</sup>Hormone receptor-positive patients receive adjuvant tamoxifen Gianni, ...Baselga. Lancet. 2010

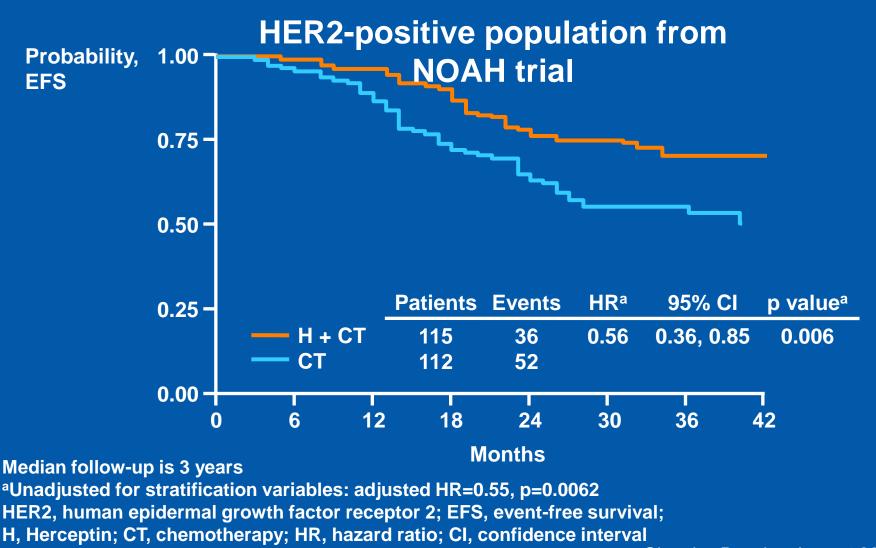

#### **NOAH: tumor response**

pCR, pathological complete response; tpCR, total pathological complete response in breast and nodes

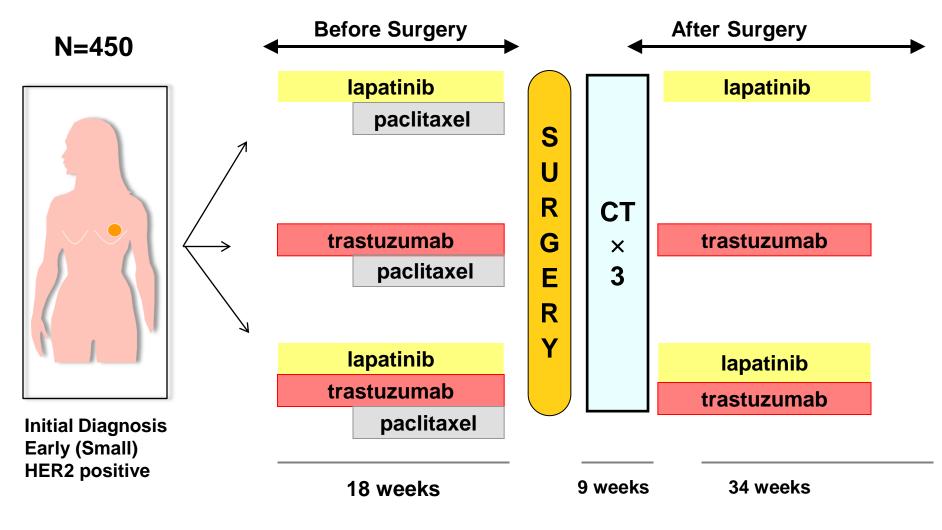

Gianni,...Baselga. Lancet. 2010

#### Neoadjuvant Trastuzumab (NOAH): Event-Free Survival

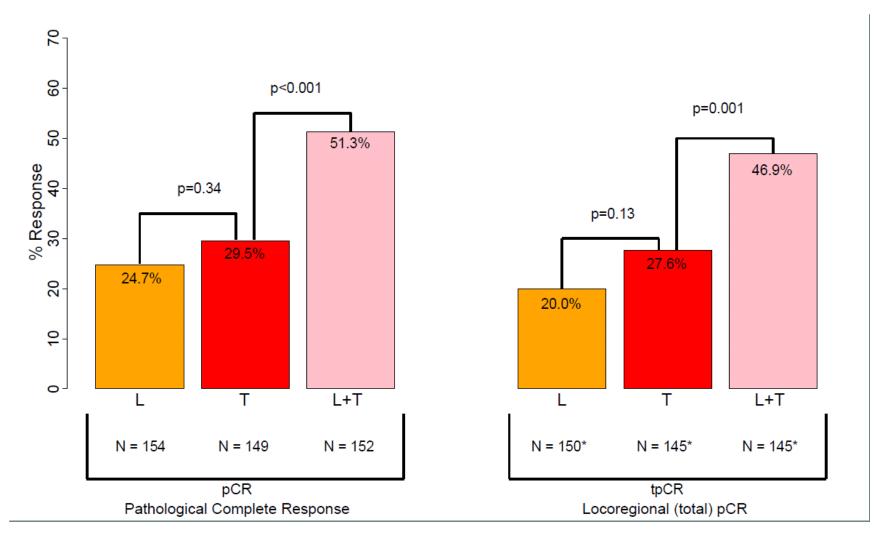

Gianni,...Baselga. Lancet 2010

#### **Apply Novel Therapies Earlier in Disease: Neoadjuvant Studies in Breast Cancer**

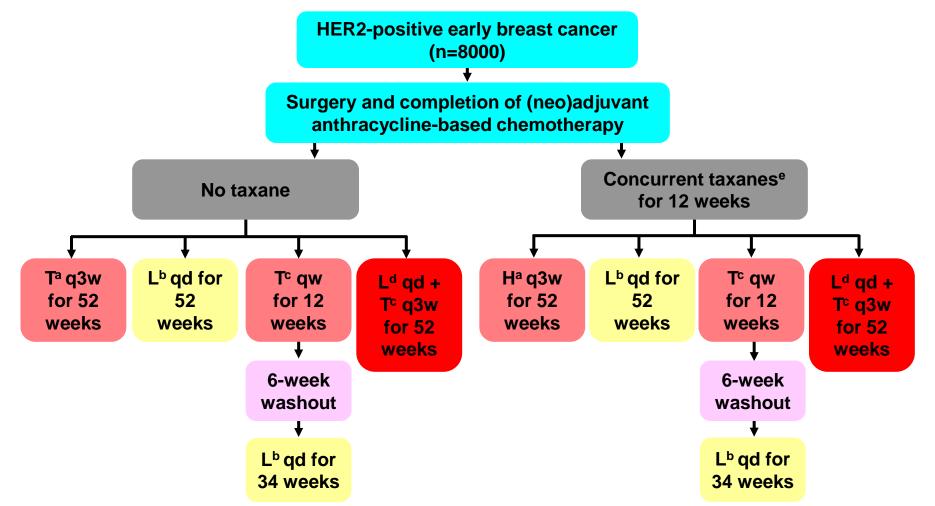

Baselga et al. Lancet 2010. Jan 16

#### Neo-ALTTO Efficacy- pCR and tpCR

Baselga et al. Lancet 2012

# ALTTO: Phase III randomised open-label trial comparing adjuvant Lapatinib +/- Trastuzumab

<sup>a</sup> Trastuzumab 8 mg/kg iv loading dose followed by 6 mg/kg q3w; <sup>b</sup>Lapatinib 1500 mg; <sup>c</sup>Trastuzumab 4 mg/kg iv loading dose followed by 2 mg/kg qw; <sup>d</sup>Lapatinib 1000 mg; <sup>e</sup>Paclitaxel 80 mg/m<sup>2</sup> qw or docetaxel q3w

# Metanalysis of Neoadjuvant trials

- To conduct a systematic review of published neoadjuvant chemotherapy studies to comprehensively evaluate:
  - Overall association between pCR with subsequent disease free survival (DFS) and overall survival (OS).
  - Association between pCR with DFS and OS in HR+, HER-2+ & triple negative (TN) breast cancer.

# **Study Results**

- Total eligible studies = 30 (till July 2011)
- Overall sample size = 11,206 patients
- Overall pCR% = 22% (range: 10%-68%)
  - HR+ = 13% (range: 3%-27%)
  - HER-2+ = 34% (range: 11%-68%)
  - TN = 31% (range: 17%-62%)

# pCR is associated with improved disease free survival

# pCR is associated with improved overall survival

#### HER-2+ Tumors

# pCR is associated with improved overall survival

### **Triple Negative Tumors**

# German Breast Cancer Group Experience N= 6377 patients in 7 Neoadjuvant Trials

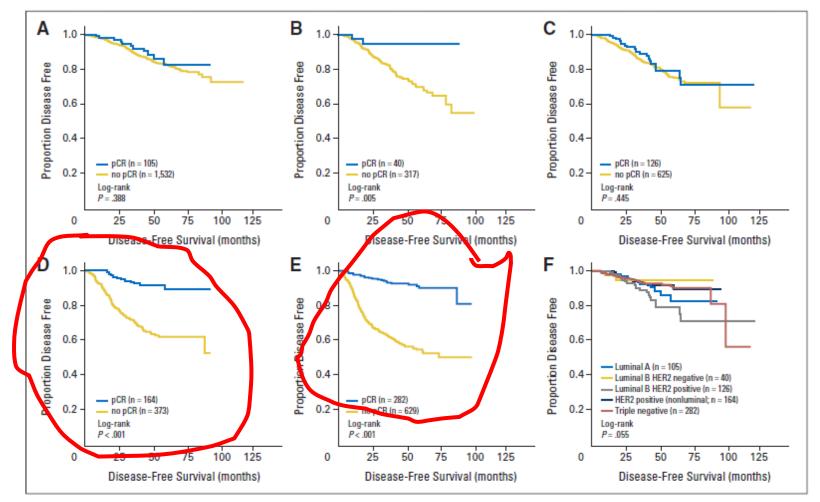

Fig 2. Prognostic impact of pathologic complete response (pCR) on disease-free survival (DFS) in 4,193 patients according to breast cancer intrinsic subtype. (A) Patients with luminal A-like tumors, (B) luminal B/human epidermal growth factor receptor 2 (HER20 –negative–like tumors, (C) luminal B/HER2-positive–like tumors, (D) HER2-positive (nonluminal) –like tumors, and (E) triple-negative tumors; (F) comparison of DFS in 717 patients achieving pCR according to breast cancer intrinsic subtype.

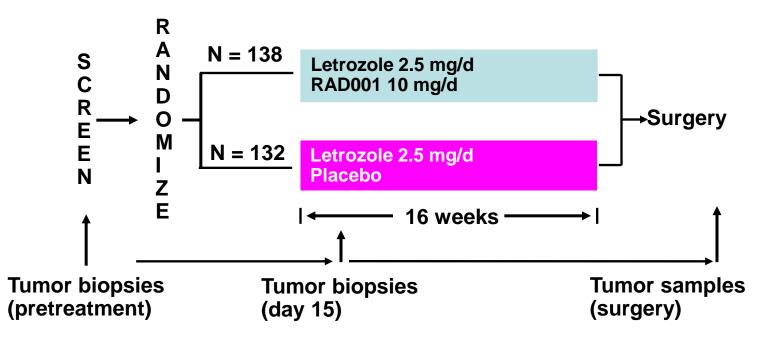

#### Von Minckwitz et al. J Clin Oncol 2012

## Conclusions

- pCR after neoadjuvant chemotherapy is associated with significantly improved DFS and OS, particularly for HER-2+ and triple negative breast cancer.
- pCR could be considered as a surrogate marker for survival outcomes as new therapies are evaluated in the neoadjuvant setting.

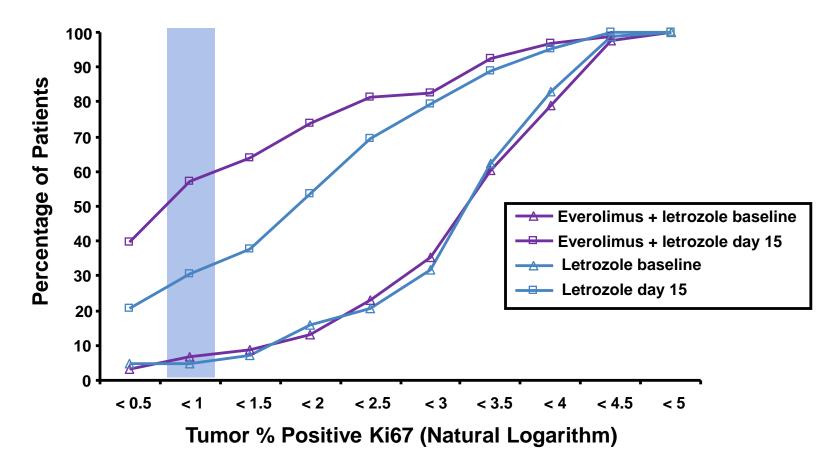

# Phase II neoadjuvant everolimus (RAD001) breast cancer study

- Newly diagnosed, untreated patients with ER<sup>+</sup> localized breast cancer likely to benefit from hormonal therapy
- Palpable tumor: > 2 cm diameter

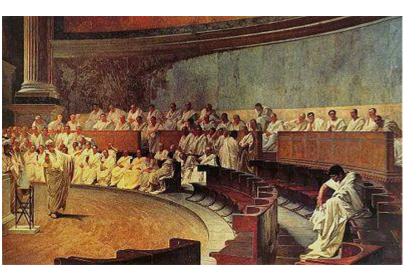

#### Phase II neoadjuvant everolimus (RAD001) breast cancer study – Change in Ki67

 At day 15, a large difference in Ki67 values is seen between the everolimus + letrozole and the placebo + letrozole arms, which was not seen at baseline

#### The Food and Drugs Administration DIXIT:

"Regular approval of a new drug requires adequate, well-controlled trials demonstrating clinical benefit, which is generally defined in early-stage breast cancer as an improvement in disease-free or overall survival"

Alternatively, the Food and Drug Administration (FDA) may grant accelerated approval on the basis of a surrogate end point that is "reasonably likely to predict clinical benefit." For neoadjuvant breast-cancer treatment, we propose that the rate of pathological complete response be used as this surrogate.

Prowell T. Food and Drug Administration. Draft Guidance for Industry. Pathologic complete response in neoadjuvant treatment of high-risk early-stage breast cancer: use as an endpoint to support accelerated approval (http://www.fda.gov/downloads/Drugs/GuidanceComplianceRegulatoryInformation/GuidanceS/UCM305501.pdf).

- Our mission is to save lives.
  - Neoadjuvant and adjuvant therapies save lives
- Yet,...we can not afford to waste years (and resources we do not have) waiting for results of adjuvant trials, that we know are going to be positive.
  - The day that ALTTO is positive, we are going to feel good but also very bad. Because we knew that trastuzumab and lapatinib was superior to trastuzumab. How many lives have we lost? Was this necessary?
  - There is not a single well conducted neoadjuvant trial that has not been confirmed in the adjuvant setting
- It is time to move forward
  - The same old approach does simply not work any longer.

• Science has spoken

Massive data from single studies as well as from meta-analysis in favor of neodjuvant studies

- pCR in TNBC and HER2 correlates with clinical outcome
- PEPI score and Ki 67 in ER positive correlates with clinical outcome
- Major academic groups embrace the concept
- Pharma has embraced it too
- Regulatory agencies have also embraced it

- Let us move forward, we should never go back.....
- Stop 10,000patient adjuvant trials

# Go Neo-Adjuvant!
