Disclosure slide

- Member of Global, European and/or French boards for Pfizer, Novartis, Bayer Schering, GlaxoSmithKline, Astellas, Dendreon for renal cell carcinoma
- Meetings and travel support by Pfizer, Novartis
- Institutional support for grants by Pfizer, Novartis, Roche
- PI for international trials for Novartis, Pfizer

First-line Treatment of mRCC

Efficacy Overview

Study	ORR, %	Median PFS, mo
Sunitinib vs IFN- α ¹	47 vs 12	11 vs 5 $P < 0.001$
Bevacizumab + IFN- α vs IFN- α ²	31 vs 13	10.2 vs 5.4 $P = 0.0001$
Bevacizumab + IFN- α vs IFN- α ³	25.5 vs 13.1	8.5 vs 5.2 $P < 0.0001$
Sorafenib vs IFN- α ⁴	5.2 vs 8.7	5.7 vs 5.6* $P = 0.50$
Temsirolimus vs IFN- α ⁵	8.6 vs 4.8	5.5 vs 3.1* $P < 0.001$
Pazopanib vs placebo ⁶	32 vs 4	11.1 vs 2.8 $P < 0.0001$

*Independent assessment.

IFN, interferon; mRCC, metastatic renal cell carcinoma; ORR, objective response rate; PFS, progression-free survival.

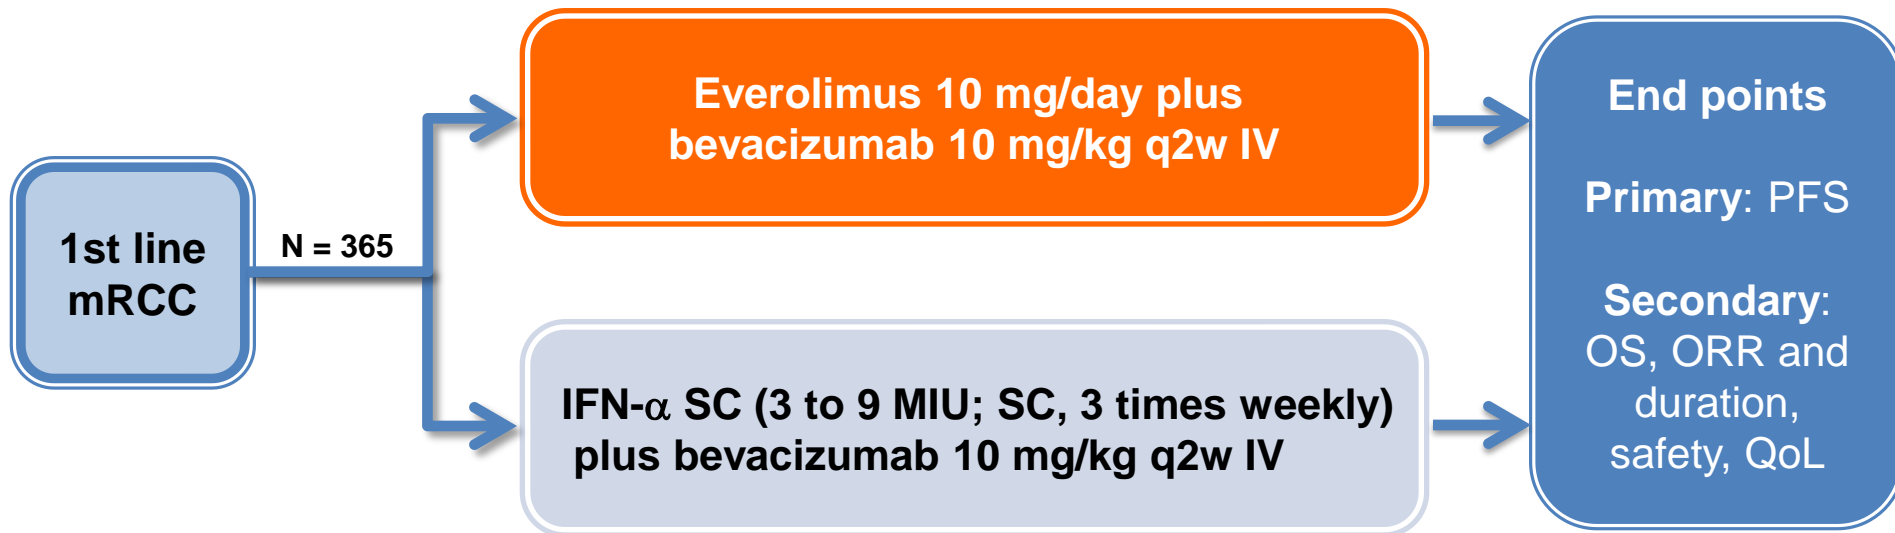

Current Status for Patients With mRCC

- The benefits of VEGF-based therapies are transient^{1,2}
 - Durable response is rarely achieved, and most patients eventually develop progressive disease
 - Relapse is thought to occur via various escape mechanisms that allow for continued angiogenesis in spite of VEGF signaling blockade
- Current treatment strategies involve sequential administration of monotherapies^{3,4}
- Combination therapy has the potential to substantially improve prognosis for patients with mRCC⁵
 - Everolimus and bevacizumab block different molecular targets^{6,7}

VEGF, vascular endothelial growth factor.

RECORD-2: Study Design

Randomized, open-label, phase II study

Key eligibility criteria:

- Age \geq 18 years with confirmation of advanced metastatic clear-cell RCC
- \geq 1 measurable lesion per RECIST criteria
- Prior nephrectomy
- KPS \geq 70%

Key exclusion criteria:

- Prior systemic treatment for mRCC, including prior therapy with VEGF or mTOR inhibitor

RECORD-2: Statistical Methods

- The primary objective was treatment effect on PFS per central review based on an estimate of the probability of success (PoS) in a subsequent phase III trial
 - The protocol-defined criterion for phase II success was: $\text{PoS} \geq 50\%$
 - The protocol-defined median PFS assumptions were: 10.2 months in the IFN- α + bevacizumab treatment arm vs 13.6 months in the everolimus + bevacizumab arm, leading to a hazard ratio of 1.33
- QoL was measured using 2 validated patient self-reported questionnaires
 - The FKSI-DRS assesses patient symptoms, including pain, fatigue, shortness of breath, fever, weight loss, coughing, and blood in urine
 - The total score can range from 0 (worst) to 36 (best)
 - A decrease by at least 2 score units represents deterioration
 - The EORTC QLQ-C30 assesses patients' physical, emotional, cognitive, social, and role function, global quality of life, and several specific symptoms
 - A 10% decrease from baseline represents deterioration

Patient Disposition

Disposition Reason		Everolimus + bevacizumab (n = 182)	IFN + bevacizumab (n = 183)
Patients randomized, %	Untreated	1	1
	Treated	99	99
Patients treated, %	Treatment ongoing*	8	10
	End of treatment	92	90
Primary reasons for end of treatment, %	Disease progression	59	61
	AEs	23	26
	Death	8	6
	Withdrew consent	7	4
	New cancer therapy	2	1
	Protocol deviation	1	1
	Lost to follow-up	1	1
	Administrative problems	0	1
Analysis set, %	Full analysis set	100	100
	Safety set	99	99

*Patients ongoing at time of cut-off (12/31/2011).

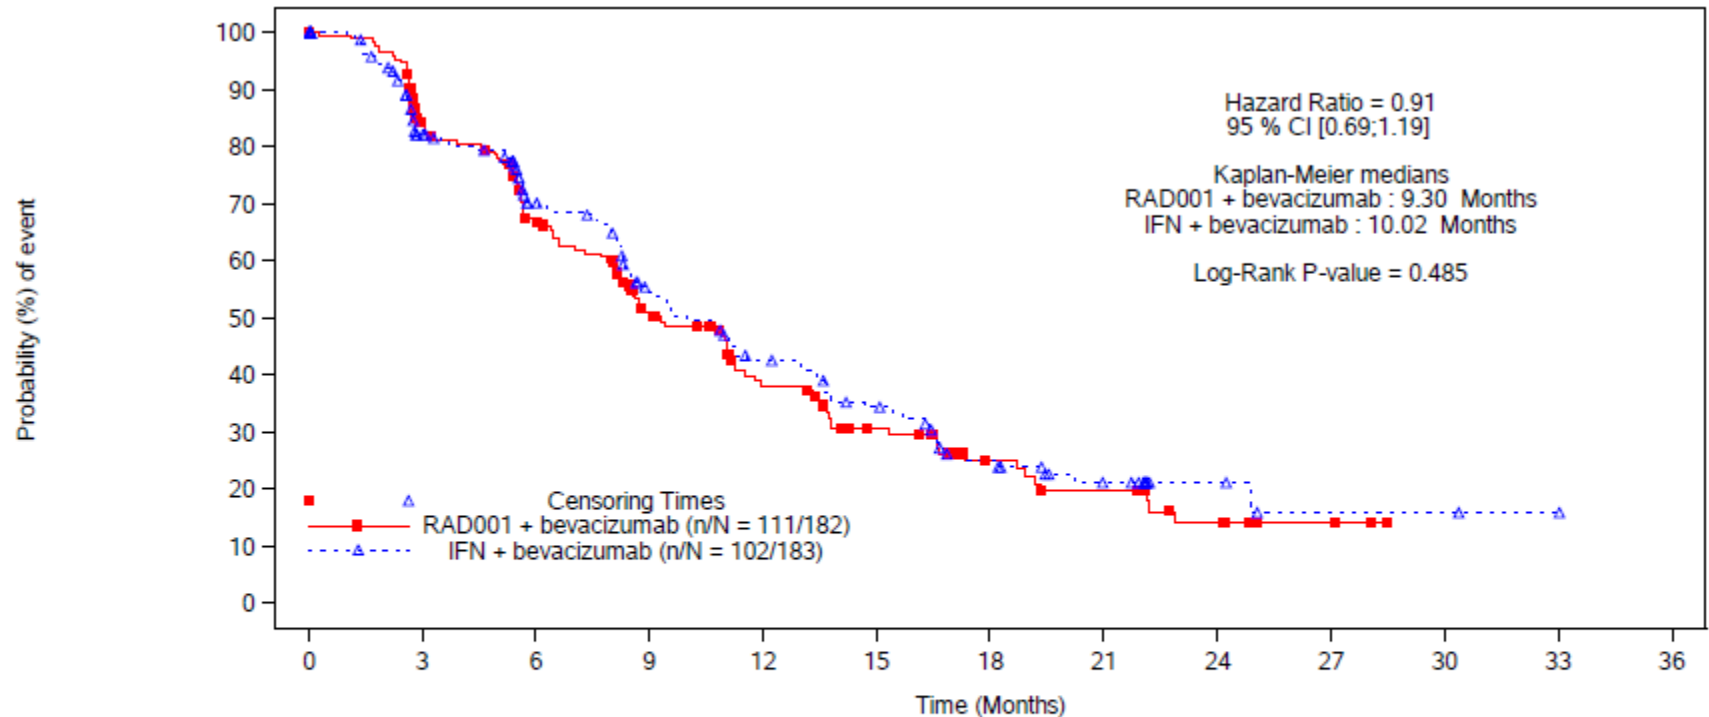

AEs, adverse events.

Demographics and Baseline Characteristics

Variable		Everolimus + bevacizumab (n = 182)	IFN + bevacizumab (n = 183)	All patients (N = 365)
Age, years	Median (range)	60 (20-84)	60 (31-81)	60 (20-84)
Male gender, %		76	72	74
MSKCC risk, %	Favorable	36	36	36
	Intermediate	57	57	57
	Poor	7	7	7
Metastatic sites, %	Lung	83	73	78
	Lymph node	47	54	50
	Bone	26	30	28
	Liver	23	20	21
	Mediastinum	15	20	17

Efficacy: PFS

Based on central review

	Number of patients still at risk												
Time (Months)	0	3	6	9	12	15	18	21	24	27	30	33	36
RAD001 + bevacizumab	182	135	98	65	43	29	19	14	7	3	0	0	0
IFN + bevacizumab	183	126	93	66	48	36	22	13	5	2	2	1	0

Log-Rank P-value is obtained from a Log-Rank test stratified by MSKCC criteria
Hazard ratio IFN/RAD is obtained from an unadjusted Cox model stratified by MSKCC criteria
In the expression (n/N), n represents the number of patients who experienced an event.

Efficacy: PFS

Based on investigator assessment

	Number of patients still at risk												
Time (Months)	0	3	6	9	12	15	18	21	24	27	30	33	36
RAD001 + bevacizumab	182	145	111	78	52	33	22	17	9	5	1	0	0
IFN + bevacizumab	183	133	104	79	59	46	30	17	7	2	2	1	0

Log-Rank P-value is obtained from a Log-Rank test stratified by MSKCC criteria

Hazard ratio IFN/RAD is obtained from an unadjusted Cox model stratified by MSKCC criteria

In the expression (n/N), n represents the number of patients who experienced an event.

Efficacy: Overall Survival

	Number of patients still at risk												
Time (Months)	0	3	6	9	12	15	18	21	24	27	30	33	36
RAD001 + bevacizumab	182	173	158	149	128	108	82	57	40	19	7	1	0
IFN + bevacizumab	183	170	161	149	135	119	92	67	43	23	11	4	0

n represents the number of patients in the population with an event

Efficacy: Response Rates

Best overall response,* n (%)	Everolimus + bevacizumab (n = 182)	IFN + bevacizumab (n = 183)
Complete response	0 (0.0)	1 (0.5)
Partial response	49 (26.9)	50 (27.3)
Stable disease	90 (49.5)	84 (45.9)
Progressive disease	25 (13.7)	26 (14.2)
Unknown	18 (9.9)	22 (12.0)
Objective response rate (ORR)[†]	49 (26.9)	51 (27.9)

*Best overall response as per central radiology review by treatment (Full Analysis Set)

[†]ORR = complete + partial response.

Efficacy:

Comparison With Previous Studies

- PFS and response rates with everolimus + bevacizumab were higher than those obtained with single-agent bevacizumab
- Results were within the range of those reported in prior studies in patients with treatment-naïve mRCC

Outcomes	Phase II				Phase III					
	RECORD-2		BEV ¹	EVE + BEV ²	IFN ± BEV ³		IFN ± BEV ⁴		SUN vs IFN ⁵	
	EVE + BEV	IFN + BEV	BEV	EVE + BEV	IFN + BEV	IFN	IFN + BEV	IFN	SUN	IFN
ORR, %	26.9	27.9	10	30	31	13	25.5	13.1	47	12
Median PFS, mo	9.3	10.0	4.8*	9.1	10.2	5.4	8.5	5.2	11	5

*Time-to-progression.

ORR, objective response rate; PFS, progression-free survival; BEV, bevacizumab; EVE, everolimus; IFN, interferon- α ; SUN, sunitinib.

Safety: Summary

Category, %	Everolimus + BEV (n = 180)	IFN + BEV (n = 181)
Deaths		
All	41	46
On-treatment ^a	11	9
AEs	99	99
Suspected to be drug related	96	90
Grade 3/4	80	76
Suspected to be drug related	64	58
Clinically notable ^b	92	82
Suspected to be drug related	89	70
Leading to discontinuation ^c	24	24
Suspected to be drug related	16	17
Requiring dose interruption and/or reduction	80	76
Requiring additional therapy ^d	94	88
SAEs	43	39
Suspected to be drug related	21	18

^aOccurring up to 28 days after discontinuation of study treatment.

^bEvents of specific clinical interest in connection with everolimus or events which are similar in nature.

^cDiscontinuation defined as stopping of both drugs of the combined treatment.

^dIncludes all non-drug therapy and concomitant medications.

SAEs, serious adverse events.

Safety: Most Common AEs

AEs ($\geq 25\%$ in either group) regardless of relationship to study drug						
AE, %	Everolimus + BEV (n = 180)			IFN + BEV (n = 181)		
	All grades	Grade 3	Grade 4	All grades	Grade 3	Grade 4
Stomatitis	63	10	1	23	2	0
Proteinuria	49	22	1	37	9	1
Diarrhea	39	2	1	27	1	0
Hypertension	38	7	0	21	6	0
Epistaxis	35	3	0	21	0	0
Fatigue	32	5	0	41	17	0
Cough	31	2	0	19	1	0
Weight decreased	28	1	0	32	3	0
Decreased appetite	27	3	0	45	5	0
Asthenia	22	4	0	34	13	1
Nausea	22	1	0	28	1	0
Pyrexia	15	0	0	35	1	0

QoL as Measured by the FKSI-DRS Risk Score

Longitudinal Analysis Results

- FKSI mean score is significantly better over the time for patients treated with everolimus compared with the IFN arm ($P < 0.001$)
- However, no significant difference between arms was shown in the time to definitive deterioration analysis ($P = 0.782$)

QoL as Measured by the EORTC QLQ-C30

Longitudinal Analysis Results

- PF mean score is significantly better over time for patients treated with everolimus compared with the IFN arm ($P = 0.032$)
- However, no significant difference between arms was shown in the time to definitive deterioration analysis ($P = 0.533$)
- For the global health status/QoL score, longitudinal analysis and time to definitive deterioration analysis did not show any significant treatment effect

Summary

- The combination of everolimus with bevacizumab did not show superiority over the combination of interferon- α with bevacizumab
 - Both study arms performed similarly in terms of PFS and response rates
 - Optimization of sequencing of single-agent treatments may have a greater chance to improve treatment outcomes compared with combination approaches
- The combination of everolimus with bevacizumab was generally well tolerated in patients with treatment-naïve RCC
- No significant difference between treatment arms was observed in the time to definitive deterioration analysis. However, the physical functioning from EORTC QLQ-C30 and FKS1 mean score is significantly better over time for patients treated with everolimus
- Final OS and safety updates for RECORD-2 are expected in Q4 2012

Countries Participating in the RECORD-2 Study
