Toward Global Harmonization of HCC Staging

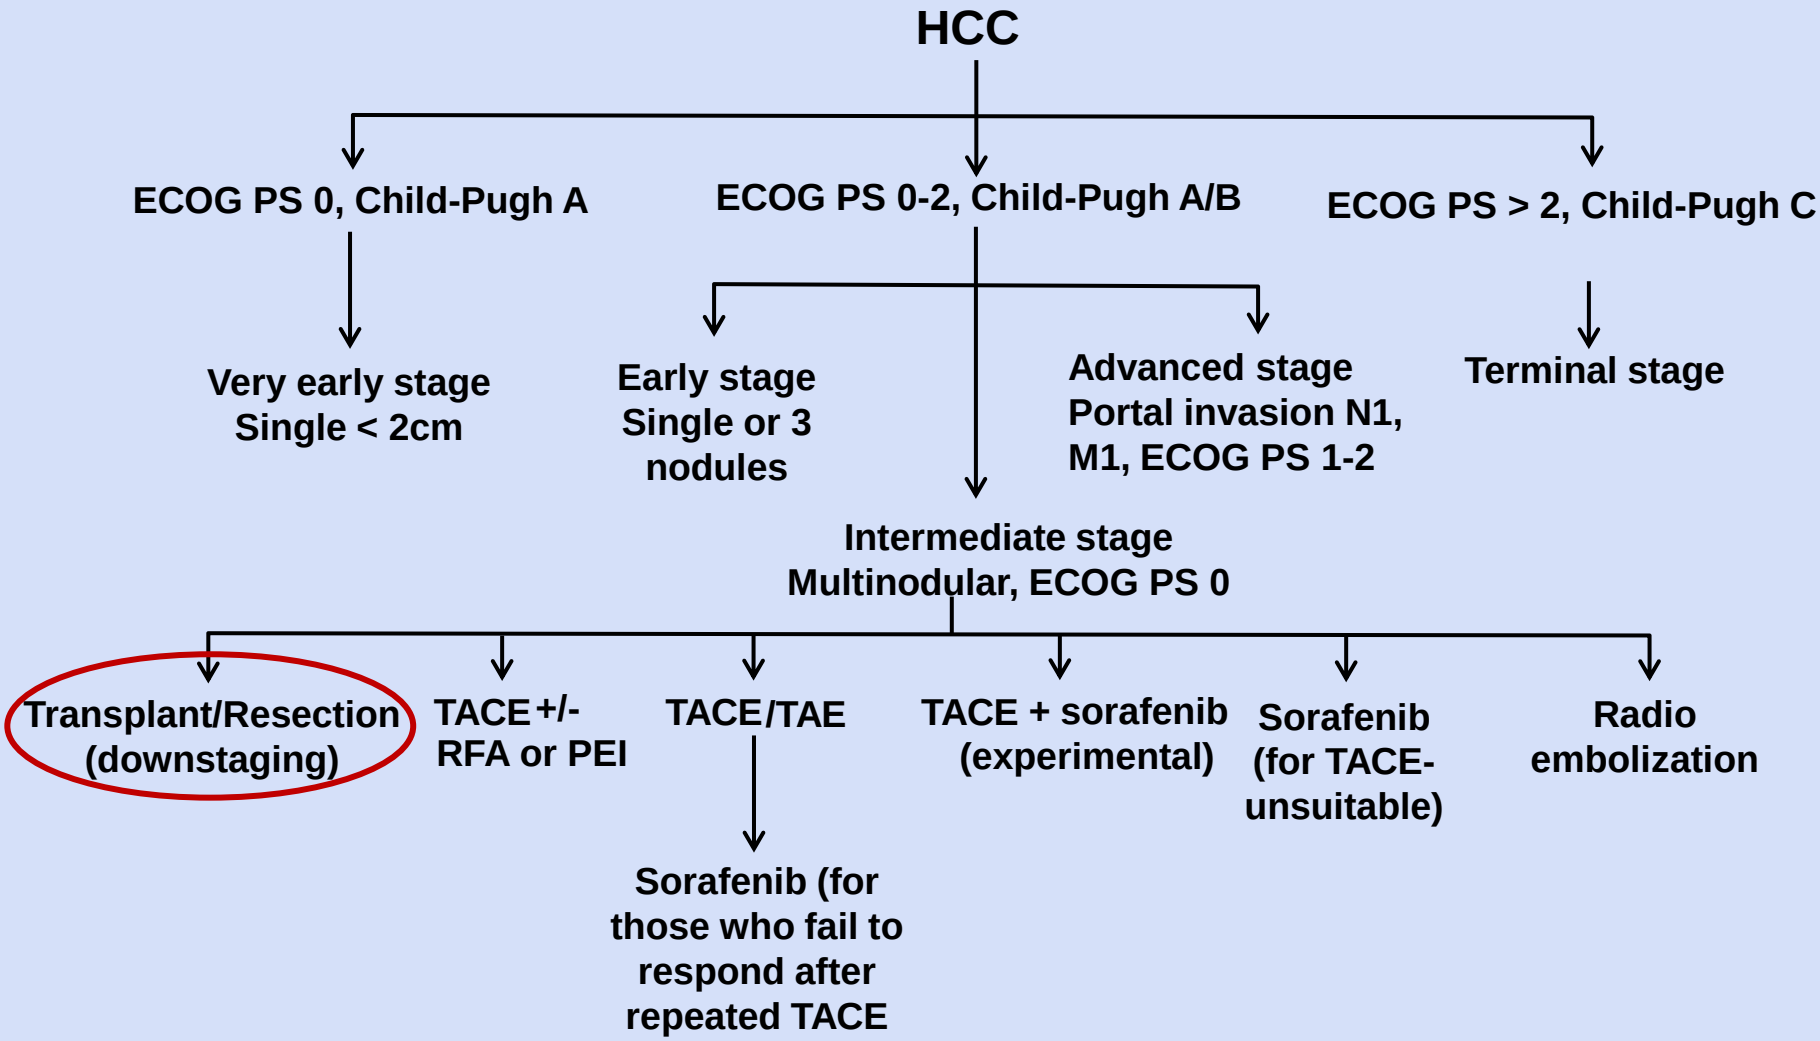
- **Globally accepted treatment-guiding staging systems are needed and should be pursued.**

Heterogeneity of Intermediate HCC (BCLC Stage B) and the Estimated Probability of Total Tumor Necrosis according to the Most Likely Potential Treatment

	Examples of Patients with Intermediate HCC			
	Patient 1	Patient 2	Patient 3	Patient 4
Bilirubin (mg/dl)	0.9	1.6	2.6	1.9
Albumin (g/dl)	4.8	3.6	3.0	2.7
Ascites	No	Mild	Mild	Refractory
Hepatic encephalopathy	No	No	No	No
Child–Pugh class	A	A	B	B
Number of HCC tumors	2	4	1	4
Diameter of the 2 largest HCC	35–16 mm	60–45 mm	110 mm	19–18 mm
Potential treatment	Surgery versus combined TACE + ablation	TACE	TACE (?)	None
Potential for cure (estimated probability of total tumor necrosis)†	65%	20%	<5%	0%

Bolondi L et al. Semin Liver Dis 2012;32:348–359

Treatment Options in Intermediate HCC



Bolondi L et al. Semin Liver Dis 2012;32:348–359

Global Harmonization of HCC Staging

- **The problem of lack of motivation**

  More aggressive locoregional therapy is believed to be ethical

  Conservative approach is considered evidence-based

- **The problem of validation methodology**

  More aggressive therapy demands higher level of technique and experience

  Prospective randomization is very difficult, if not impossible

Heterogeneity of the Etiology of HCC

:Toward Global Harmonization

Regional Variation in the Estimated Age-Standardized Incidence Rates of Liver Cancer.

Summary

Toward Global Harmonization of HCC Staging and Etiology

- **Globally accepted treatment-guiding staging systems of HCC should be pursued.**

- **Etiology of HCC will reach global harmonization 3 decades from now. Virus will become minor, while metabolic/alcoholic will become major causes, and the incidence will be 10-20 new cases/100,000 population/year around the world.**

Neither Multiple Tumors Nor Portal Hypertension Are Surgical Contraindications for HCC

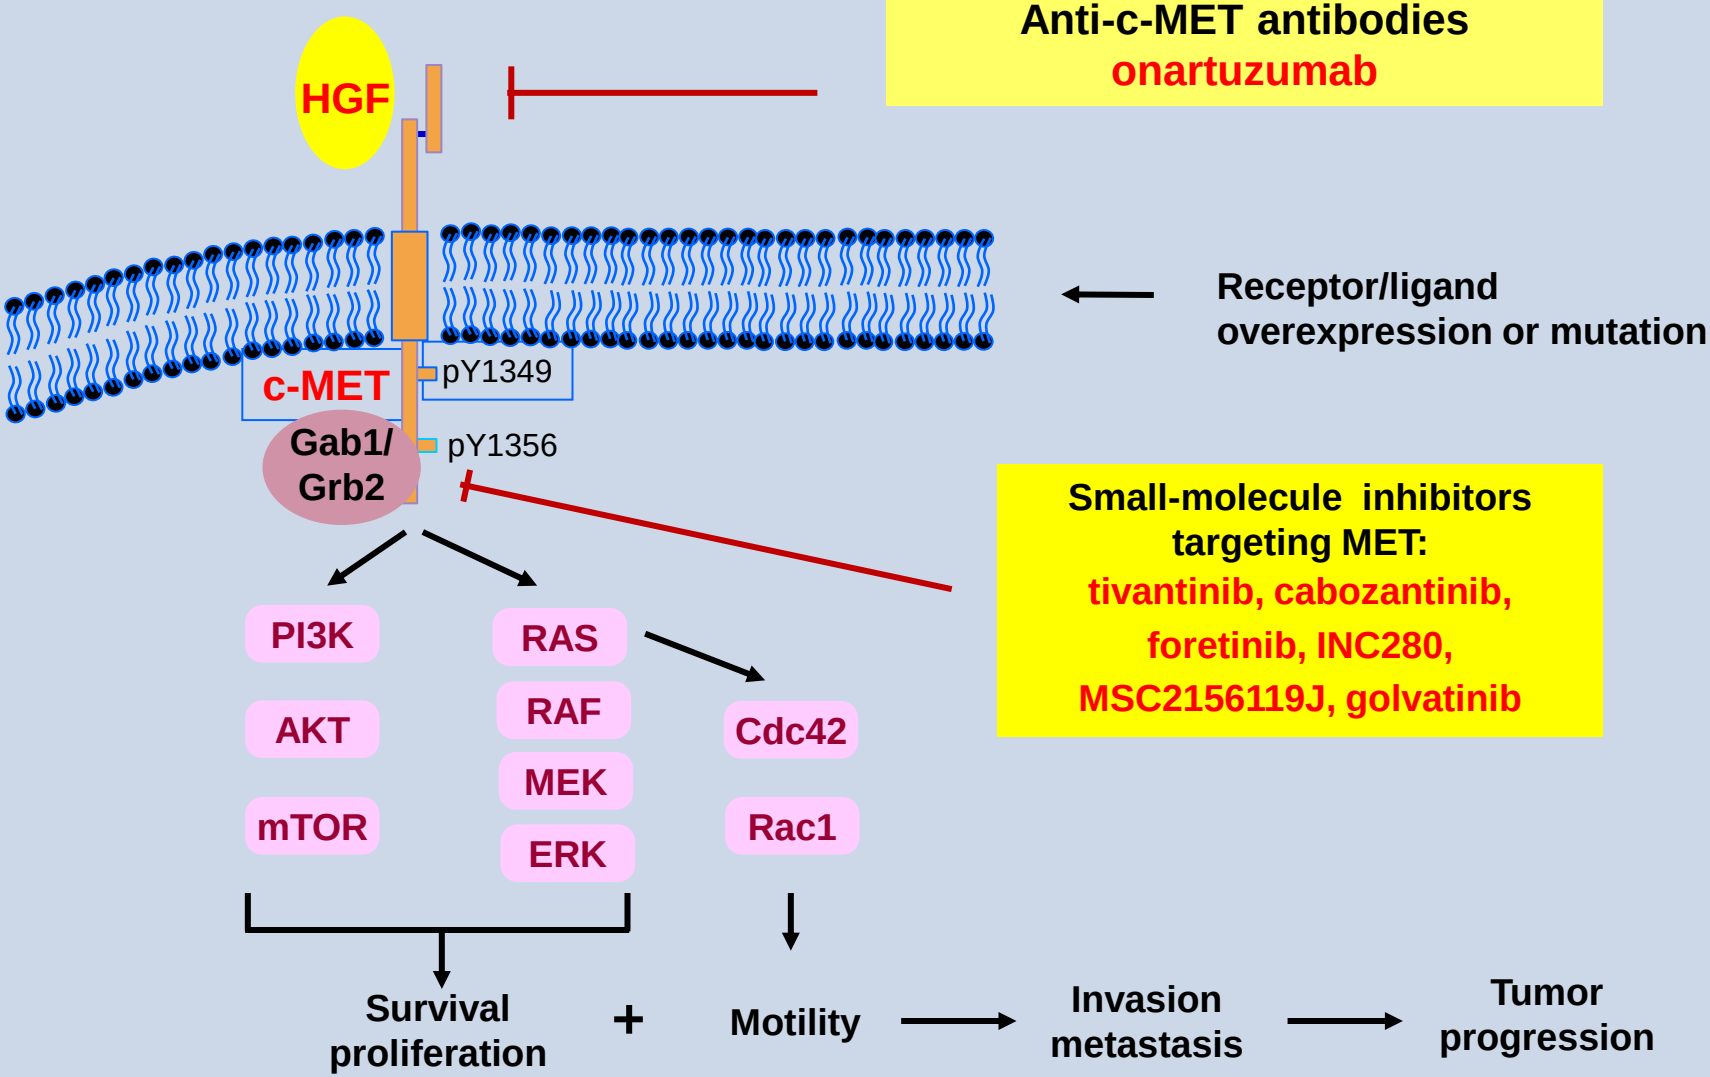
c-MET Targeted Agents in HCC



Ongoing Trials of c-MET Inhibitors for HCC

Drug/ (Identifier)	Design	Patients	Primary outcome	Site	Start date/ Status
Tivantinib (NCT01755767)	III, randomized Placebo-controlled	Failed systemic therapy, c-MET high	OS	International	2012-Dec Recruiting
Tivantinib (NCT02029157)	III, randomized Placebo-controlled	Failed systemic therapy, c-MET high	PFS	Japan	2014-Jan Recruiting
INC280 (NCT01737827)	II, single arm	1st line, c-MET dysregulation	TTP	China, Hong-Kong, Singapore, Thailand	2013-Mar Recruiting
INC280 (NCT01964235)	II, randomized Placebo-controlled	Failed sorafenib, c-MET dysregulation	TTP	Europe, USA, Hong-Kong, Australia	2014-Mar Suspended
Cabozantinib (NCT01908426)	III, randomized Placebo-controlled	Failed sorafenib	OS	International	2013-Aug Recruiting
MSC2156119J (NCT02115373)	I/II, single arm	Failed sorafenib, Phase II: c-MET+	No. of DLT in cycle 1	International	2014-May Recruiting
MSC2156119J (NCT01988493)	I/II, randomized Sorafenib-controlled	First-line c-MET+ Asian	No. of DLT in cycle 1; TTP	Germany	2014-Jan Recruiting

New Targets for HCC

- **Wnt/β-Catenin**
- **JAK/STAT**
- **FGF19/FGFR4**
- **VEGF-A**
- **c-MET**
- **TSC-2**

FGF19-FGFR4 Signaling Is Important in HCC Carcinogenesis and Survival

- FGF19-FGFR4 drives hepatocarcinogenesis in preclinical studies.
- FGF19-FGFR4 cross-talks with Wnt/β-catenin pathway.
- Inhibition of FGF19-FGFR4 signaling has shown *in vitro* and *in vivo* anti-cancer activities against HCC.

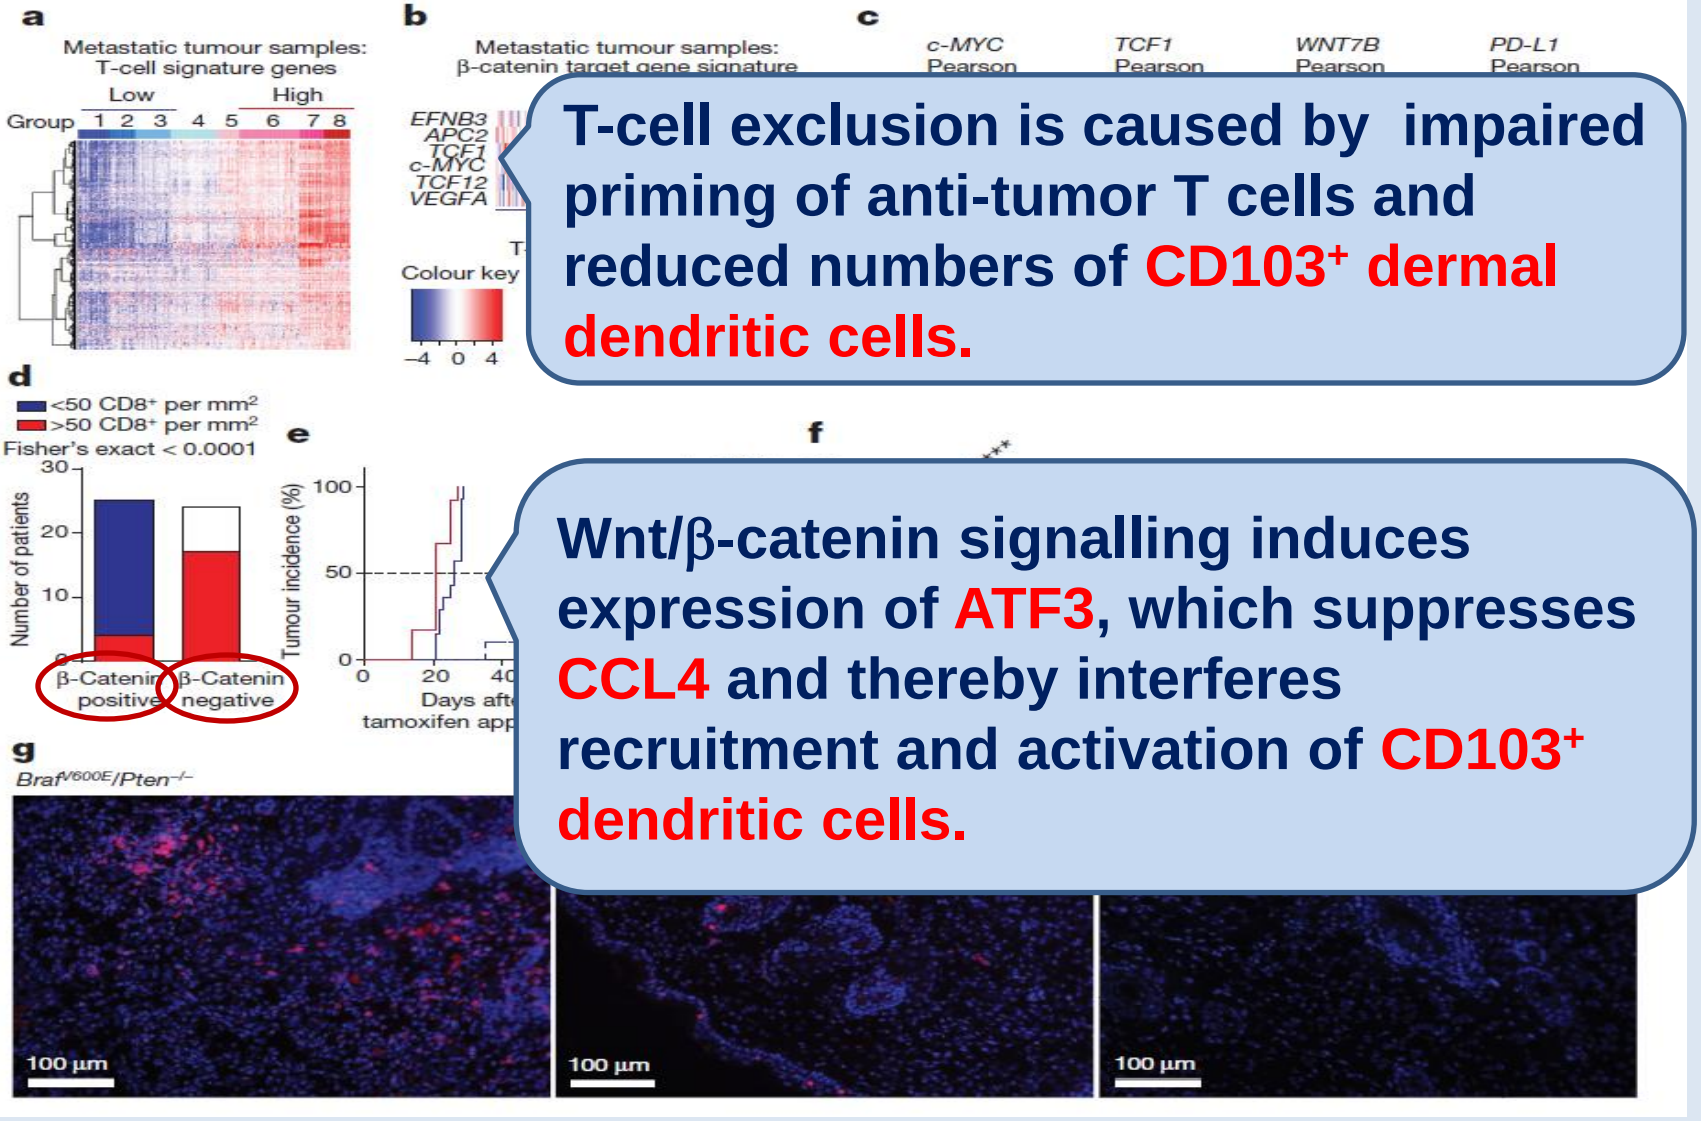
Teng MW, et al. Cancer Res. 2015;75(11):2139-2145.

Melanoma-intrinsic β-catenin Pathway Activation Correlates with T-cell Exclusion



T-cell exclusion is caused by impaired priming of anti-tumor T cells and reduced numbers of CD103⁺ dermal dendritic cells.

Wnt/β-catenin signalling induces expression of ATF3, which suppresses CCL4 and thereby interferes recruitment and activation of CD103⁺ dendritic cells.

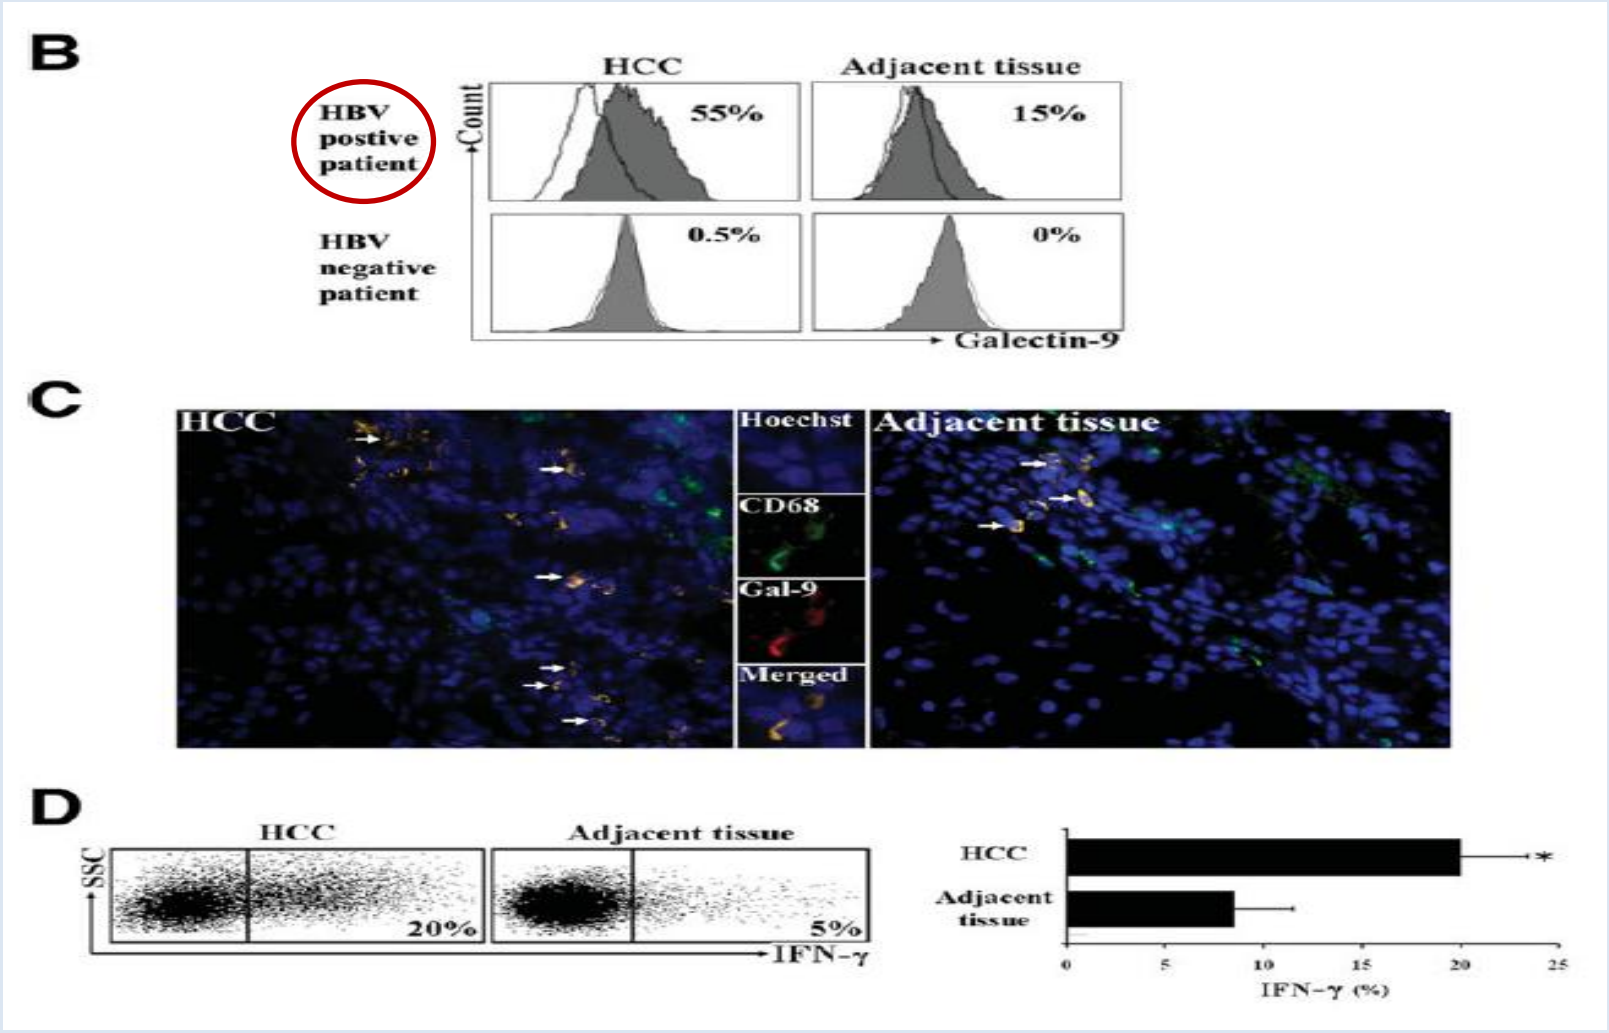
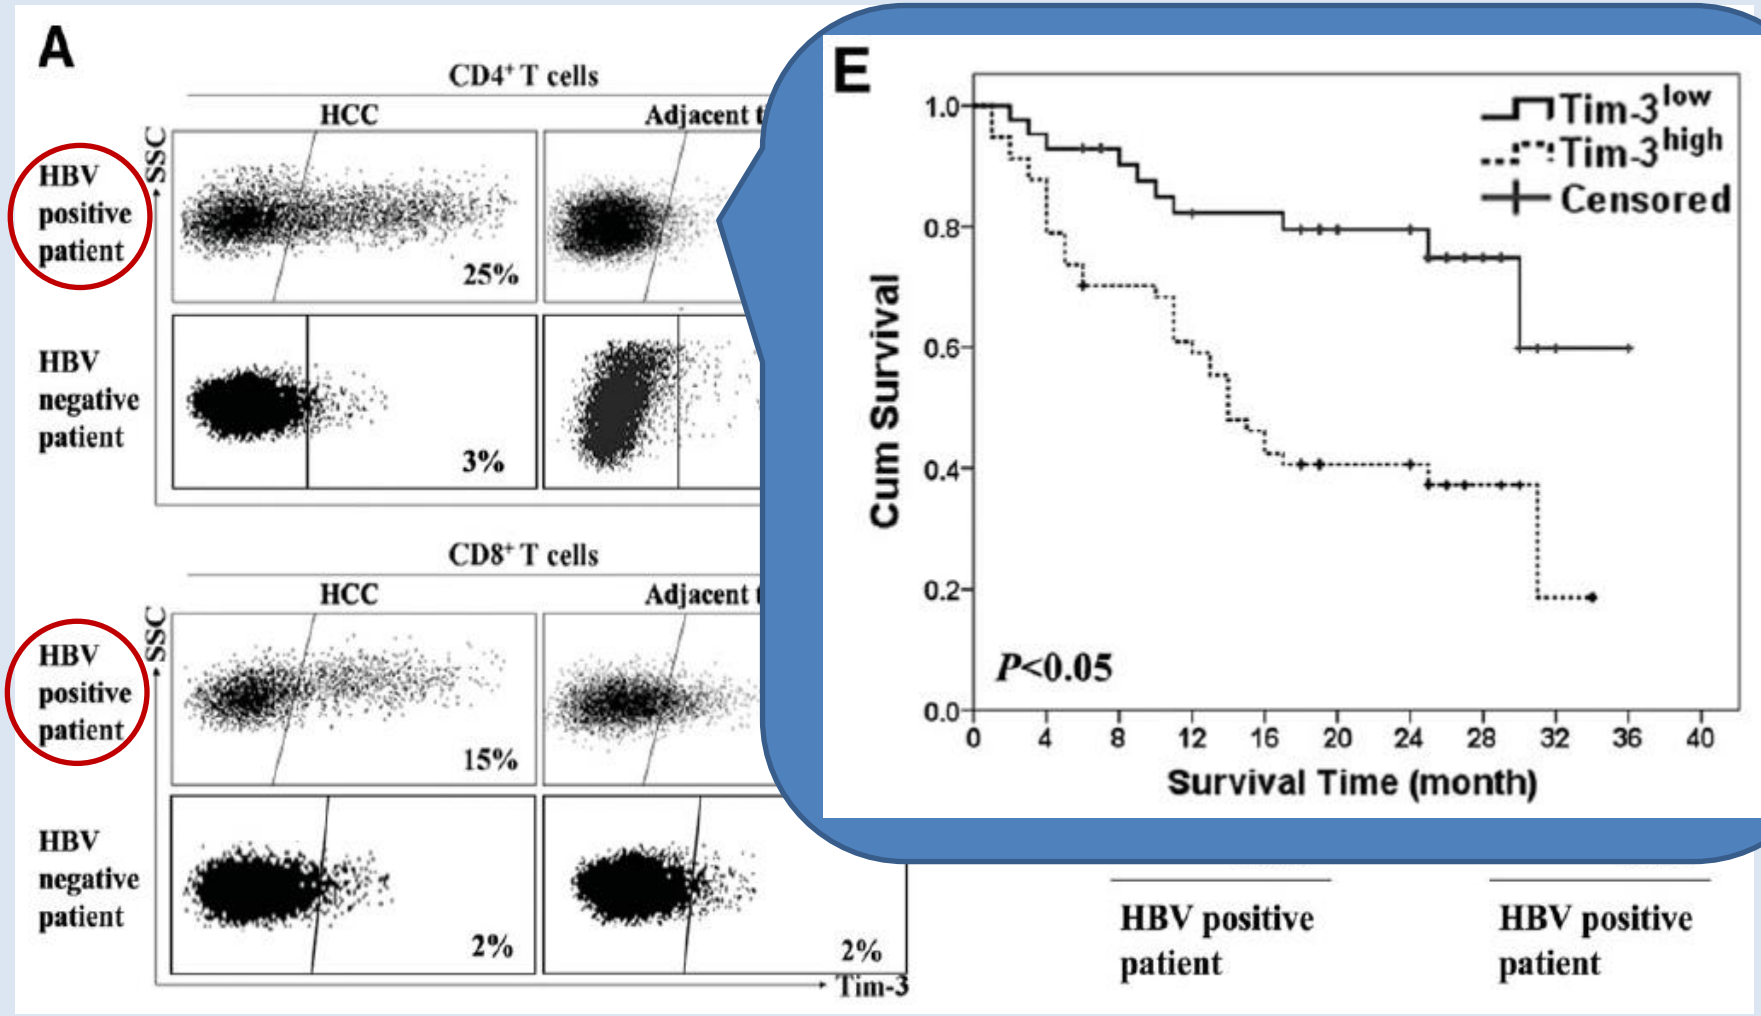
Kupffer Cells of HBV-HCC Express High Level of Galectin-9



Li H et al. Hepatology 2012;56:1342-1351

HBV-HCC is Associated with Higher Expression of Tim-3 of Infiltrating T cells



Li H et al. Hepatology 2012;56:1342-1351

Conclusions

- Novel molecular target therapy beyond sorafenib , such as lenvatinib, regorafenib, cabozantinib, c-MET inhibitors, and FGFR4 inhibitors are being investigated.
- Immunotherapy holds promise, but needs to be refined by better patient enrichment.
- Combination of MTT and immunotx. is an important direction for research.
- Exploration of unique immunobiologic features of HCC is mandatory for personalized targeted and/or immunotherapy.

TACE Outcomes

Tumor remission

- WHO, RECIST, EASL, m-RECIST
- “Lipiodol retention”

Tumor progression

- TACE failure
- TACE refracotry
- TACE unsuitable
- TACE unrepeatable
- TACE contraindicated
- Untreatable progression
- ……

TACE Failure/Refi

Evaluated by Size? Lipiodol ? or Enhancement/necrosis?

1. **TACE ineffective in controlling TACEed tumors**
   - ≥ 2 , 3 in 6 months , or 4 in 6 months → **TACE Refractory**

2. **Hepatic recurrence after effective TACE** → **Non-TACEable hepatic recurrence**
   - Further TACE not possible (e.g. sustained as
     invasion, deteriorated liver function, bleedi
     problems such as AP/AV shunt, small arteries, poor tumor stain)
   - Further TACE possible (progression of TACEed tumors or emergence of new tumors)

3. **TACE not recommended due to systemic condition**
   - Distant metastases – significant vs
   - Deteriorated performance status
   - (α-FP)

} **TACE not recommended**

TTUP

Time to untreatable progre
nab
fit from TACE:
- Failure to [illegible] objective response after at least two TACE [illegible]ule
- Appearance of c
  - Vascular invasion
  - Extrahepatic spread
  - Sustained ascites
  - Sustained Child-Pugh B
  - Clinical progression to ECOG P
  - Platelet count < 60,000/μL

Minor branch invasion is not considered contraindication

No maximum number, Asian Drs tend to do more

Insignificant mets is not considered contraindication.

Subjective, may overlap with post-TACE syndrome

Can be managed by transfusion

mRECIST for HCC

A target lesion should meet all the following criteria:

- The lesion can be classified as a RECIST measurable lesion (i.e., the lesion can be accurately measured in at least one dimension as 1 cm or more).
- The lesion is suitable for repeat measurement.
- The lesion shows intratumoral arterial enhancement on contrast-enhanced CT or MRI.

It is important to point out that only well-delineated, arterially enhancing lesions can be selected as target lesions for mRECIST.

Lencioni R et al. Semin Liver Dis 2010; 30(1): 052-060

Which Response Criteria Best Help Predict Survival of Patients with HCC Following Chemoembolization?

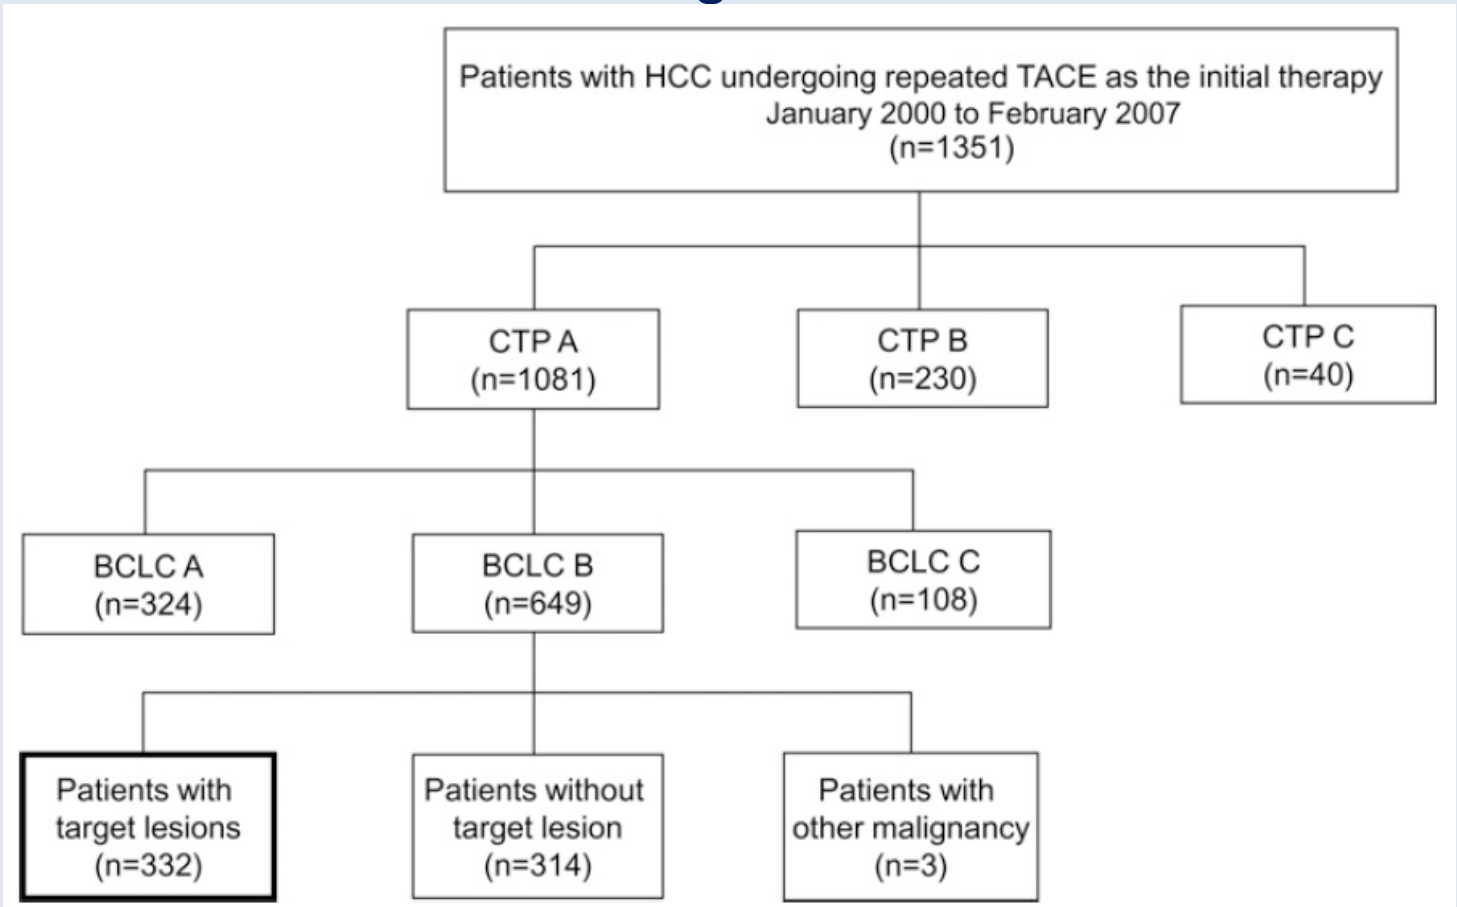

Figure 1: Flowchart of the patient selection process. *CTP A* = Child-Turcotte-Pugh class A, *CTP B* = Child-Turcotte-Pugh class B, *CTP C* = Child-Turcotte-Pugh class C, TACE = transarterial chemoembolization.

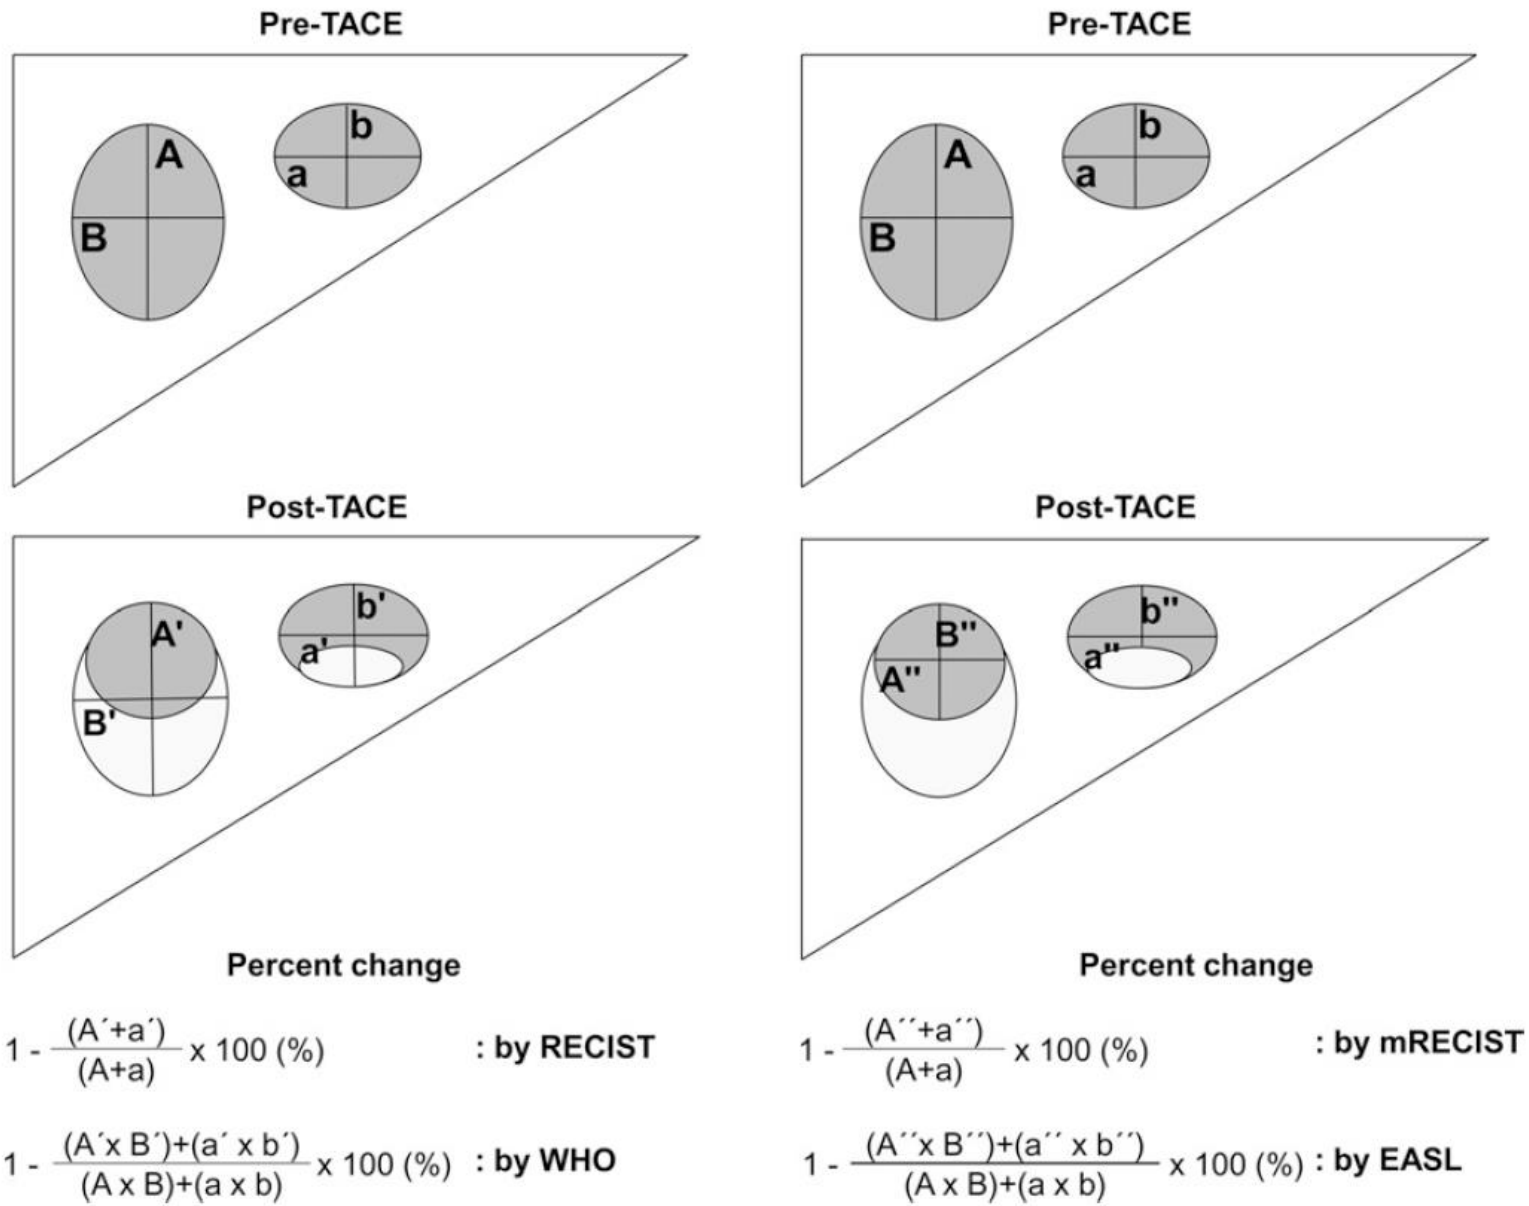
Shim JH et al. Radiology 2010;262(2):708-718.

Figure 3



Shim JH, et al. *Radiology* 2012; 262: 708

Definition of TACE Failure/Refractoriness (LCSGJ)

(1) Intrahepatic lesion

i. Two or more consecutive ineffective responses seen within the treated tumors (viable lesion >50%), even after changing the chemotherapeutic agents and/or reanalysis of feeding artery, on response evaluation CT/MRI after 1–3 months following adequately performed selective TACE

ii. Two or more consecutive progressions in the liver (including an increase in the number of tumors compared to that before the previous TACE procedure), even after changing the chemotherapeutic agents and/or reanalysis of feeding artery, on response evaluation CT/MRI after 1–3 months following adequately performed selective TACE

(2) Tumor marker

Continuous elevation of tumor markers right after TACE even though transient minor reduction is observed.

(3) Appearance of vascular invasion

(4) Appearance of extrahepatic spread

Emerging Biomarkers for Cancer Immunotherapy

- Mutation burden, neo-antigen burden, mismatch-repair deficiency
- Tumor infiltrating lymphocyte(TIL), Immunoscore
- PDL1 expression
- Tumor associated macrophage (TAM), myeloid-derived suppressor cell (MDSC)

Immunotherapy Biomarkers in the Tumor Microenvironment

Immunohistochemistry	Flow cytometry and functional assay	RNA and DNA
Baseline		
• Ipilimumab: higher levels of IDO1 and FOXP3 at baseline were associated with clinical activity[156]. • Pembrolizumab: density of $CD8^+$ T cells at the invasive margin was associated with response. Other potential predictors include $PD1^+$ T cells in proximity to $PDL1^+$ cells, and clonal T cell repertoire observed in responders[138].	NA	• Ipilimumab: high expression of immune-related genes (including *IDO1*) was associated with clinical activity[157]. • Atezolizumab: expression of CTLA4 and fractalkine was associated with response and progression, respectively. Expression of IFNγ-inducible genes in melanoma was associated with response[45].
Post-treatment		
• Tremelimumab: increased infiltration of $CD8^+$ T cells; increased numbers of HLA-DR^+ and $CD45RO^+$ memory T cells. No change in $FOXP3^+$ T cells or IDO1-expressing cells post-treatment versus pretreatment[158]. • Ipilimumab: possible association between clinical activity and an increase in total TILs by week 4 relative to baseline; $CD8^+$ T cell/$FOXP3^+$ T cell ratio post-treatment is associated with the degree of necrosis[156,160]. • Pembrolizumab: a significantly higher level of expression of the IFNγ-inducible protein STAT1 was seen in responders at baseline and after PD1 inhibition[138]. • Atezolizumab: a decrease in tumour size seems to be associated with an increase in PDL1 expression on tumour and immune cells. Progressing lesions seem to have no intratumoural inflammation and no PDL1 expression[45].	• Tremelimumab: one patient had >40% $CD3^+$; TILs were $CD4^-$ with HLA-DR^+, $CD45RO^+$, $CD27^{2+}$ and $CCR7^-$ (memory phenotype)[158]. • Ipilimumab: one patient with a regressing lesion had a higher number of a subset of NK cells ($CD56^+CD16^-$) than of lymphocytes[159]. One patient showed an autologous T cell (TIL) response to neoantigens that increased after treatment[144]. • An expansion of the $CD8^+$ T cell population specific for shared tumour antigens in peripheral blood was found after treatment[107]. • Pembrolizumab: in blood from a patient with NSCLC, a neoantigen-specific T cell response was observed that increased during tumour regression[145].	• Ipilimumab: general increase in the expression of immune-related genes associated with clinical activity; general increase in the expression of IFNγ and T_H1 cell-associated markers[157]. • Nivolumab: there was an increase in the expression of MIG and IP10 (REF. 161). • Atezolizumab: the RNA expression pattern from regressing lesions was consistent with $CD8^+$ T cell and T_H1 cell phenotypes, but there was no change in FOXP3 expression[45].

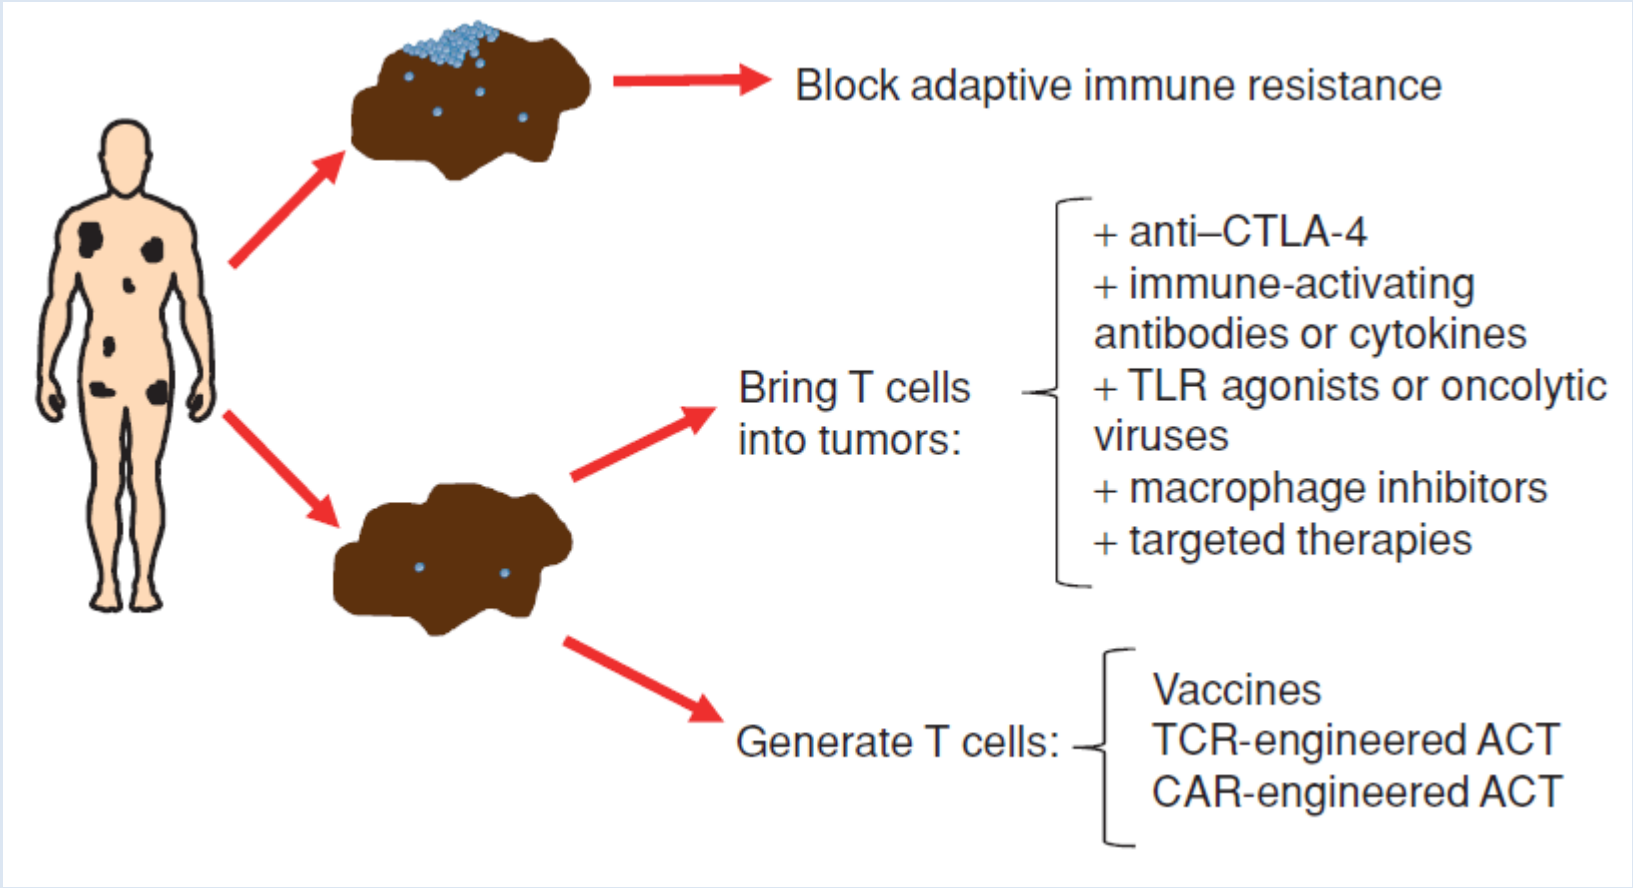
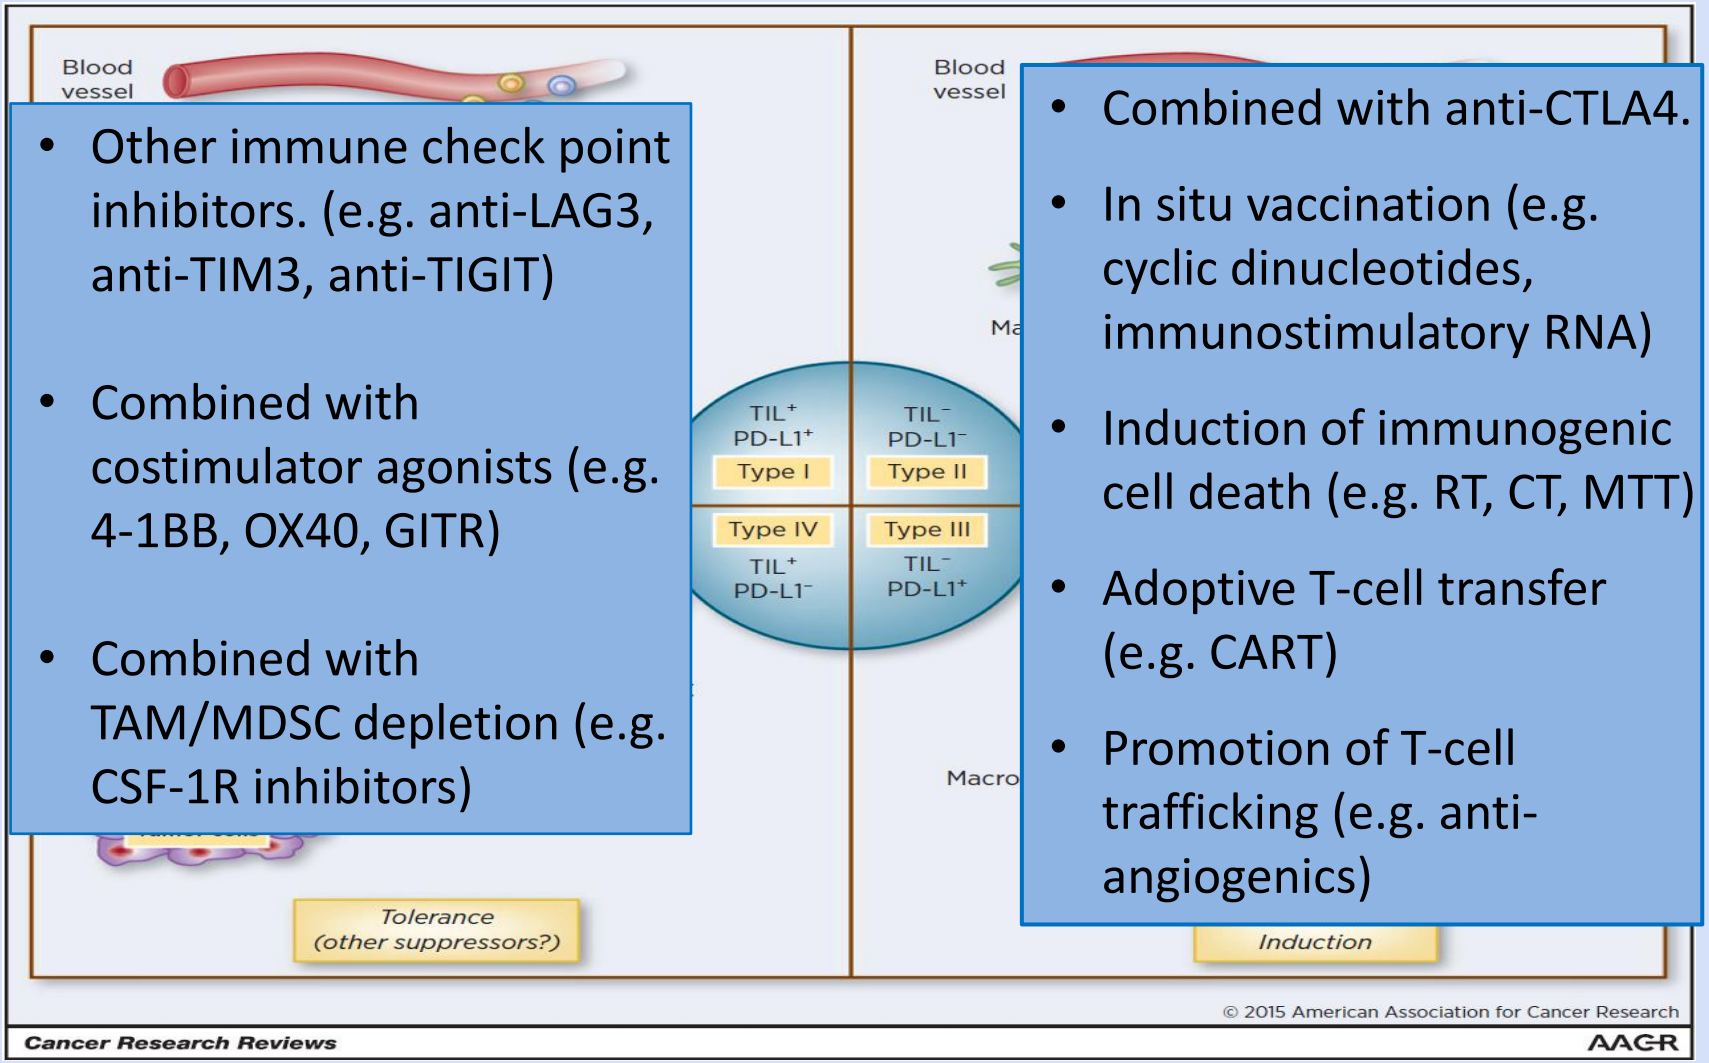
Treatment Selection Based on Detecting Adaptive Immune Resistance



Ribas A *Cancer Discovery 2015;5(9); 915–9.*

Classifying Cancers Based on T-cell Infiltration and PD-L1



- Other immune check point inhibitors. (e.g. anti-LAG3, anti-TIM3, anti-TIGIT)
- Combined with costimulator agonists (e.g. 4-1BB, OX40, GITR)
- Combined with TAM/MDSC depletion (e.g. CSF-1R inhibitors)

- Combined with anti-CTLA4.
- In situ vaccination (e.g. cyclic dinucleotides, immunostimulatory RNA)
- Induction of immunogenic cell death (e.g. RT, CT, MTT)
- Adoptive T-cell transfer (e.g. CART)
- Promotion of T-cell trafficking (e.g. anti-angiogenics)

Teng MW, et al. Cancer Res. 2015;75(11):2139-2145.

Combination of Immune Checkpoint Inhibitors

- PDR001 (αPD-1) + LAG525 (αLAG-3)
  * This concept is also under investigation by BMS
  * LAG525: effects on Treg?
- PDR001 (αPD-1) + MBG453 (αTIM-3)
  * MBG453: first-in-class? Effects on TAM, Treg?

Innate Immunity Modulator w/wo Immune Checkpoint Inhibitor

- BLZ945 (selective CSF-1R RTKi) ± PDR001

  *BLZ945: first-in-class? The other competitors are αCSF1R

- MCS110 (αCSF-1) ± PDR001

  *MCS110: first-in-class

- CDNs (STING agonist) ± PDR001

  *CDNs: first-in-class; usually combined with vaccines as adjuvant and administered via intra-tumor injection in preclinical studies

Immune Checkpoint Inhibitor Plus Costimulatory Receptor Activator

- PDR001 (αPD-1) + LKZ145 (agonistic αGITR)

  * Similar concept is currently under investigation by BMS:

    αPD-1 + α4-1BB

  * LKZ145: not first-in-class

Potential partners (drug x) of PDR001

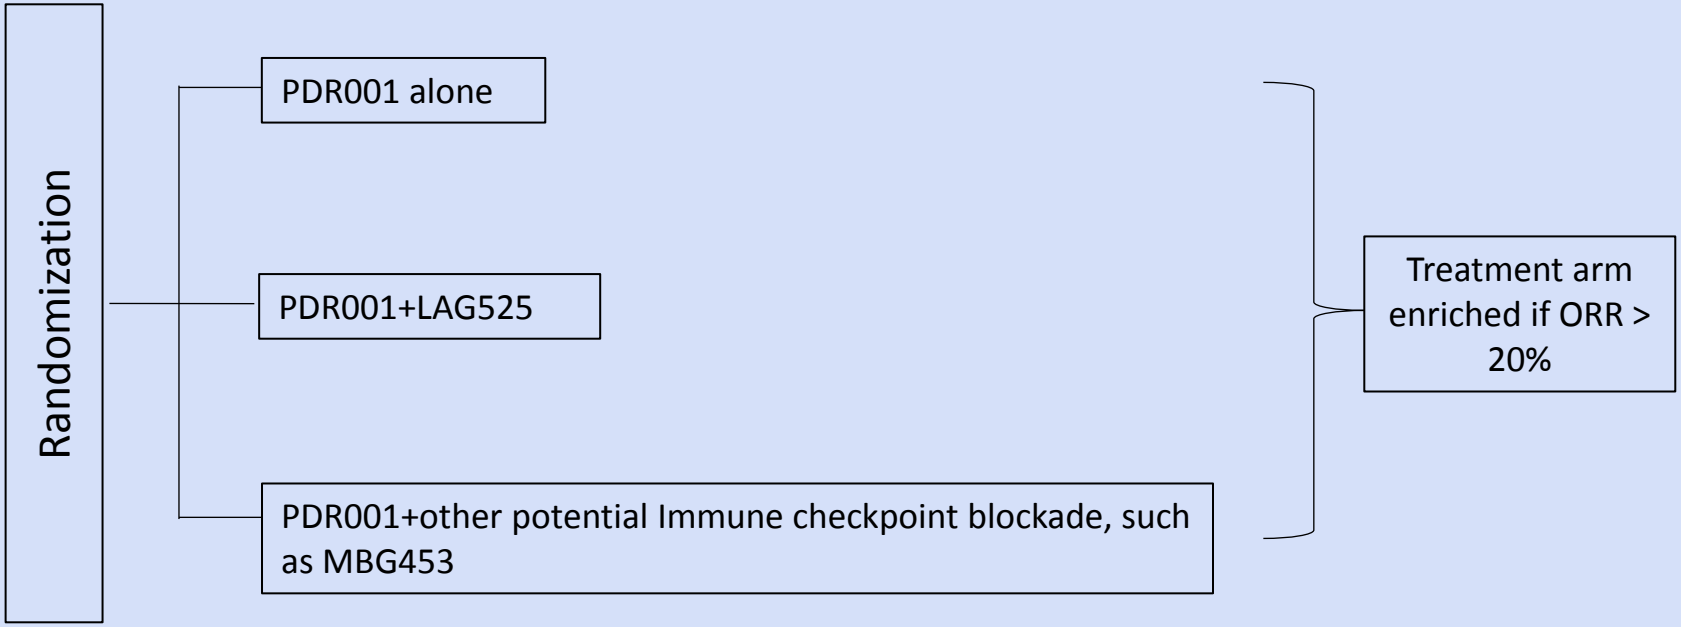
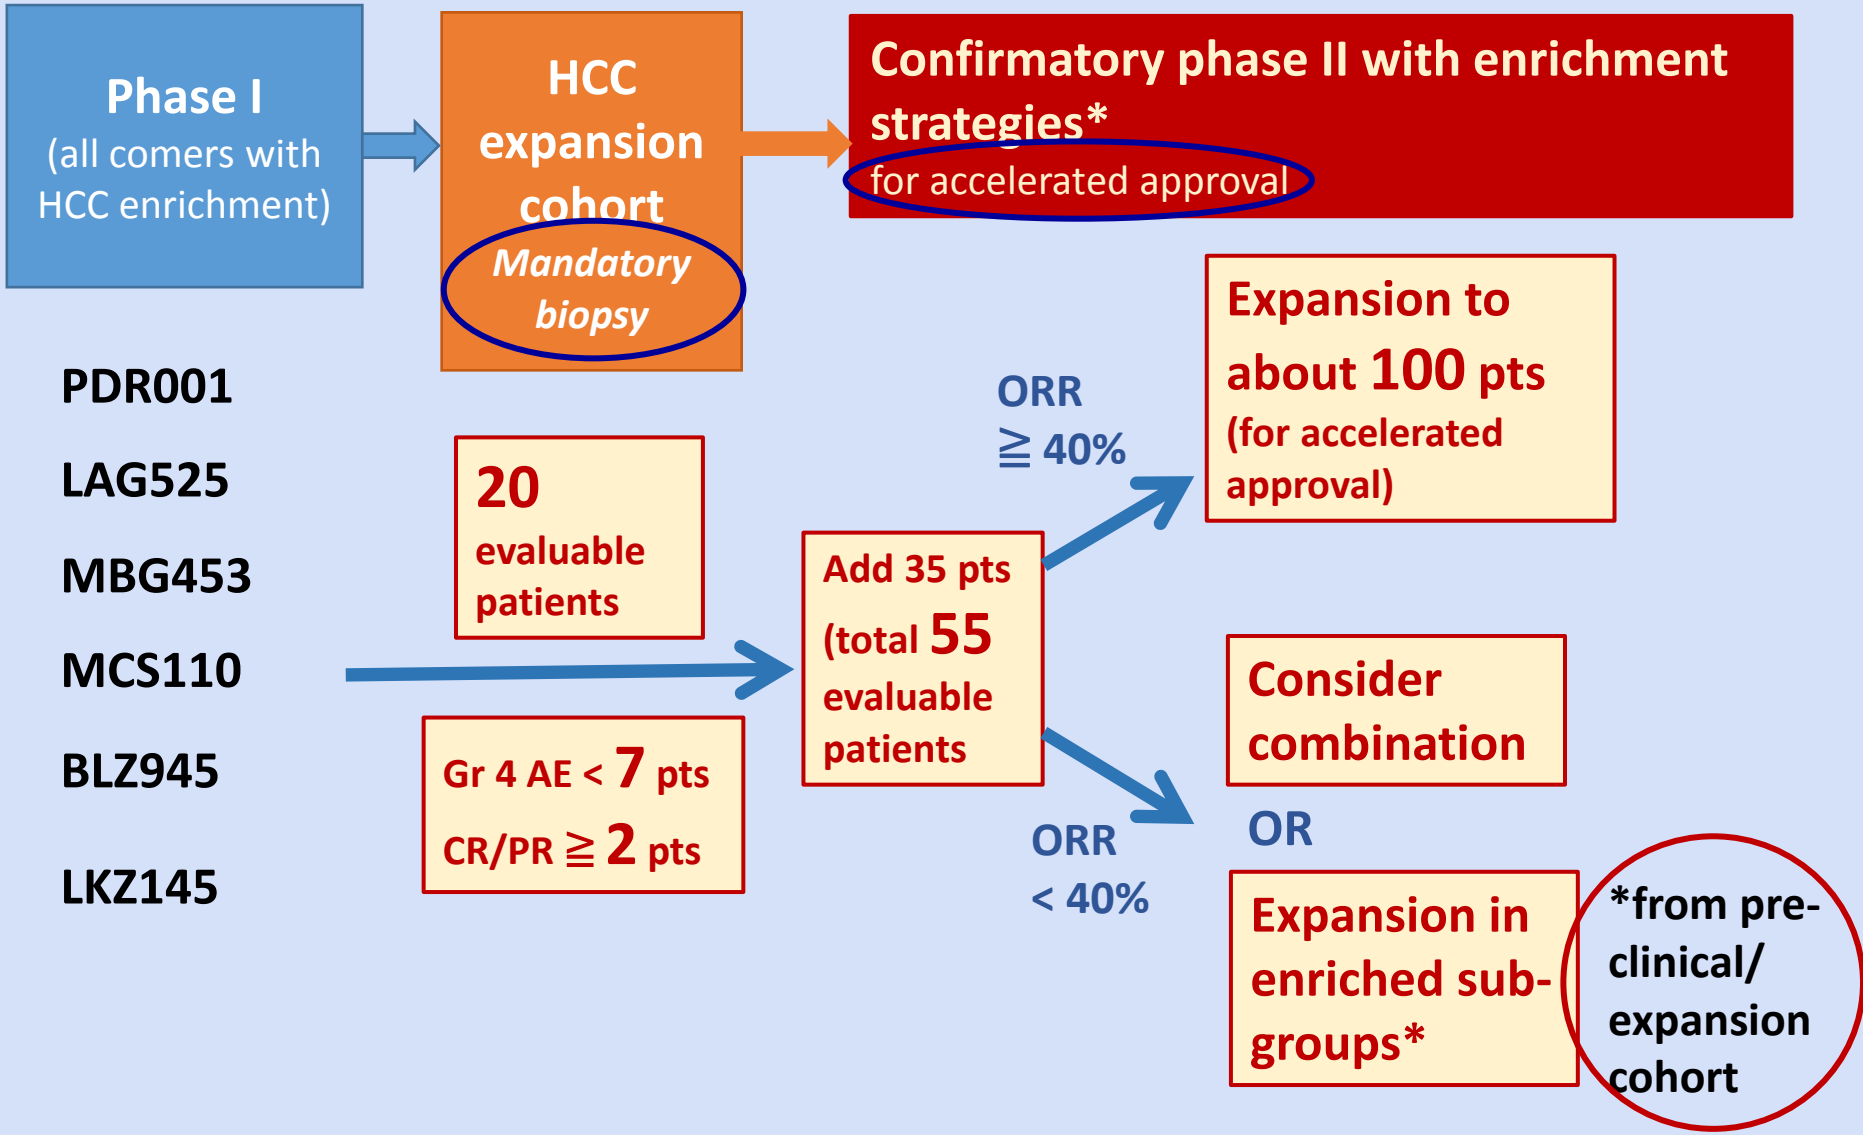
Cluster protocol of immunotherapy for advanced HCC

Open-label, randomized phase II study

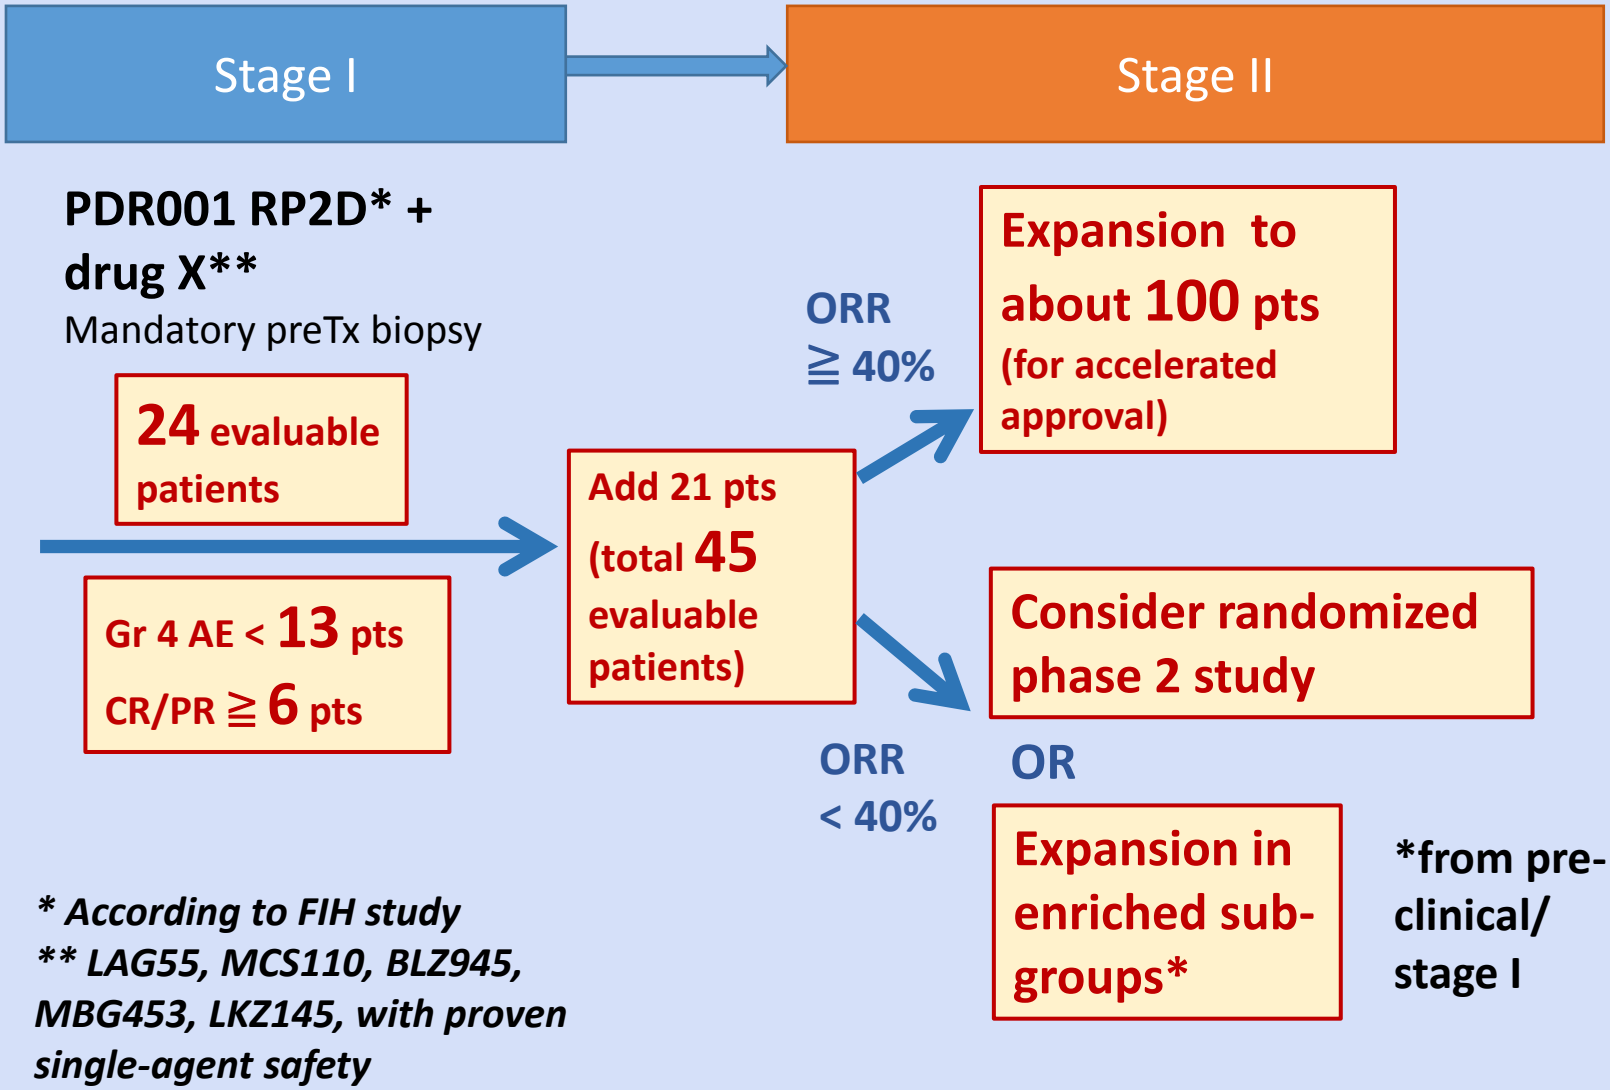


- RP2D: depends on phase I results of individual compound studies (LAG525X2101, MBG453X2101)
- If phase II is in the enriched patient group based on 1) immune score and 2) mutation load, and with ORR >40% and/or OS >15mths in extended cohorts (10-20 patients on the same dose), it is possible to explore fast track approval in Asian countries, such as Taiwan

Immunotherapy for advanced HCC (1): single agent



Immunotherapy for advanced HCC (2): PDR001 plus drug X combinations



** According to FIH study*
*** LAG55, MCS110, BLZ945, MBG453, LKZ145, with proven single-agent safety*

Master Protocol for Novartis 2nd-line HCC

- Exploratory, single-arm

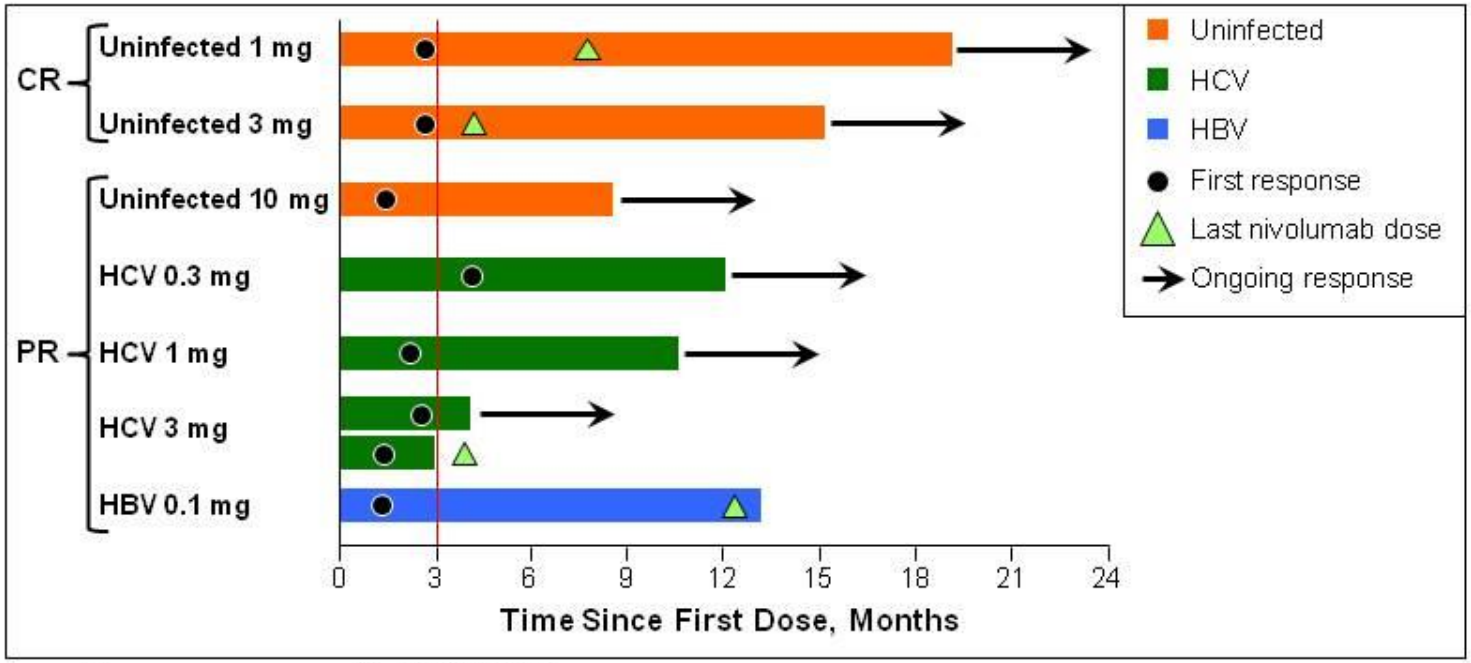
Investigator-Assessed Best Overall Response

	Uninfected (n=21)	HCV (n=11)	HBV (n=10)	Total Evaluable* (n=42)
Objective response, n (%)	3 (14)	4 (36)	1 (10)	8 (19)
Complete response	2 (10)	0	0	2 (5)
Partial response	1 (5)	4 (36)	1 (10)	6 (14)
Stable disease	10 (48)	5 (45)†	5 (50)	20 (48)
Progressive disease	8 (38)	2 (18)	4 (40)	14 (33)
Ongoing response, n (%)	3/3 (100)	3/4 (75)	0	6/8 (75)

Responses assessed by RECIST 1.1
*5 patients not evaluable: first disease assessment not yet performed in 4 patients, 1 patient died from clinical progression before disease assessment
†Patient with resolved HCV infection

Time to and Durability of Response



- 7/8 patients responded within 3 months of beginning treatment
- Responses ongoing in 6/8 patients, including 2 patients who discontinued treatment due to CR

Responses assessed by RECIST 1.1

Immunotherapy for hepato-biliary cancers

Anti-PD1 therapy and beyond

Anti-PD1 for advanced hepatocellular carcinoma (HCC)

- **Nivolumab** 0.1-10 mg/kg every 2 weeks
- Progression/intolerance/refusal to sorafenib
  - 3 cohorts: un-infected, HBV (+), HCV (+)
- 2 CR (5%), 6 PR (15%) in 39 evaluated patients
  - un-infected (21) 2 CR/ 1 PR
  - HBV (+) (10) 1 PR
  - HCV (+) (11) 4 PR
- 12-month overall survival: 62%.

- El-Khoueiry AB, et al. J Clin Oncol 33, 2015 (suppl; abstr LBA101)

Anti-PD1 for advanced biliary tract carcinoma (BTC)

- **Pembrolizumab** 10 mg/kg every 2 weeks
- Progression/intolerance to standard systemic therapy
- PD-L1 (+)
  - ≥1% of cells in tumor and stroma
  - QualTek IHC assay, 22C3 antibody clone (Merck)
- 37 of 89 (42%) patients screened were PD-L1-(+); 24 (65%) enrolled.
- ORR (confirmed and unconfirmed): 17% (95%CI, 5%-39%)
  - 0 CR, 4 PR, 4 SD

- Bang YJ, et al. ESMO 2015, P259

Future trials of anti-PD1/anti-PD-L1 therapy for HCC

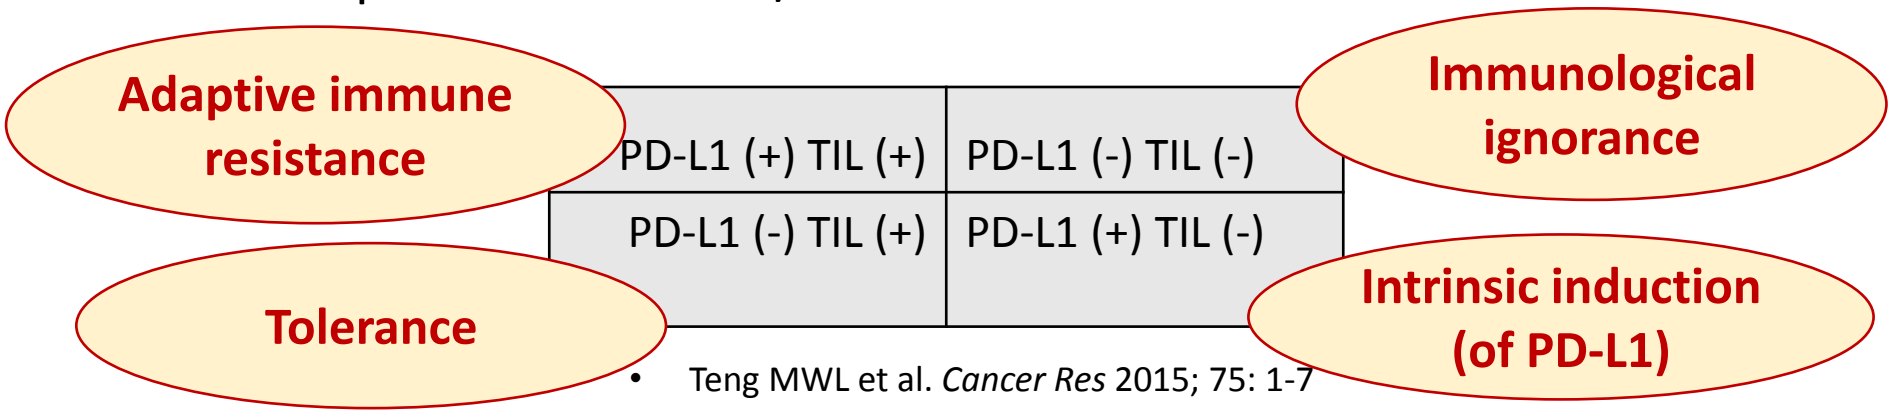
- **Advanced stage disease**
  - First-line:
    - Head-to-head comparison of anti-PD1/anti-PD-L1 with sorafenib
  - Second-line:
    - Head-to-head comparison of anti-PD1/anti-PD-L1 with placebo
    - Exploration of anti-PD1/ anti-PD-L1 based combination
      - NCT02519348 (MEDI4736 + tremelimumab)
- **Early/ Intermediate stage disease**
  - Combination with ablation therapy/TACE

Future trials of immunotherapy for BTC

- **Recurrent/metastatic disease**
  - First-line:
    - Combination of anti-PD1/anti-PD-L1 with chemotherapy
      - NCT02268825 (pembrolizumab + FOLFOX)
  - Second-line:
    - Head-to-head comparison of anti-PD1/anti-PD-L1 with placebo
    - Exploration of anti-PD1/ anti-PD-L1 based combination
      - NCT01938612 (MEDI4736 +/- tremelimumab)
- **Post surgical therapy**
  - Combination with adjuvant chemoradiation (for margin (+) or LN (+) diseases)

Potential predictive biomarkers for anti-PD-1/ anti-PD-L1 therapy

- PD-L1 expression in tumor/immune cells



- Teng MWL et al. *Cancer Res* 2015; 75: 1-7

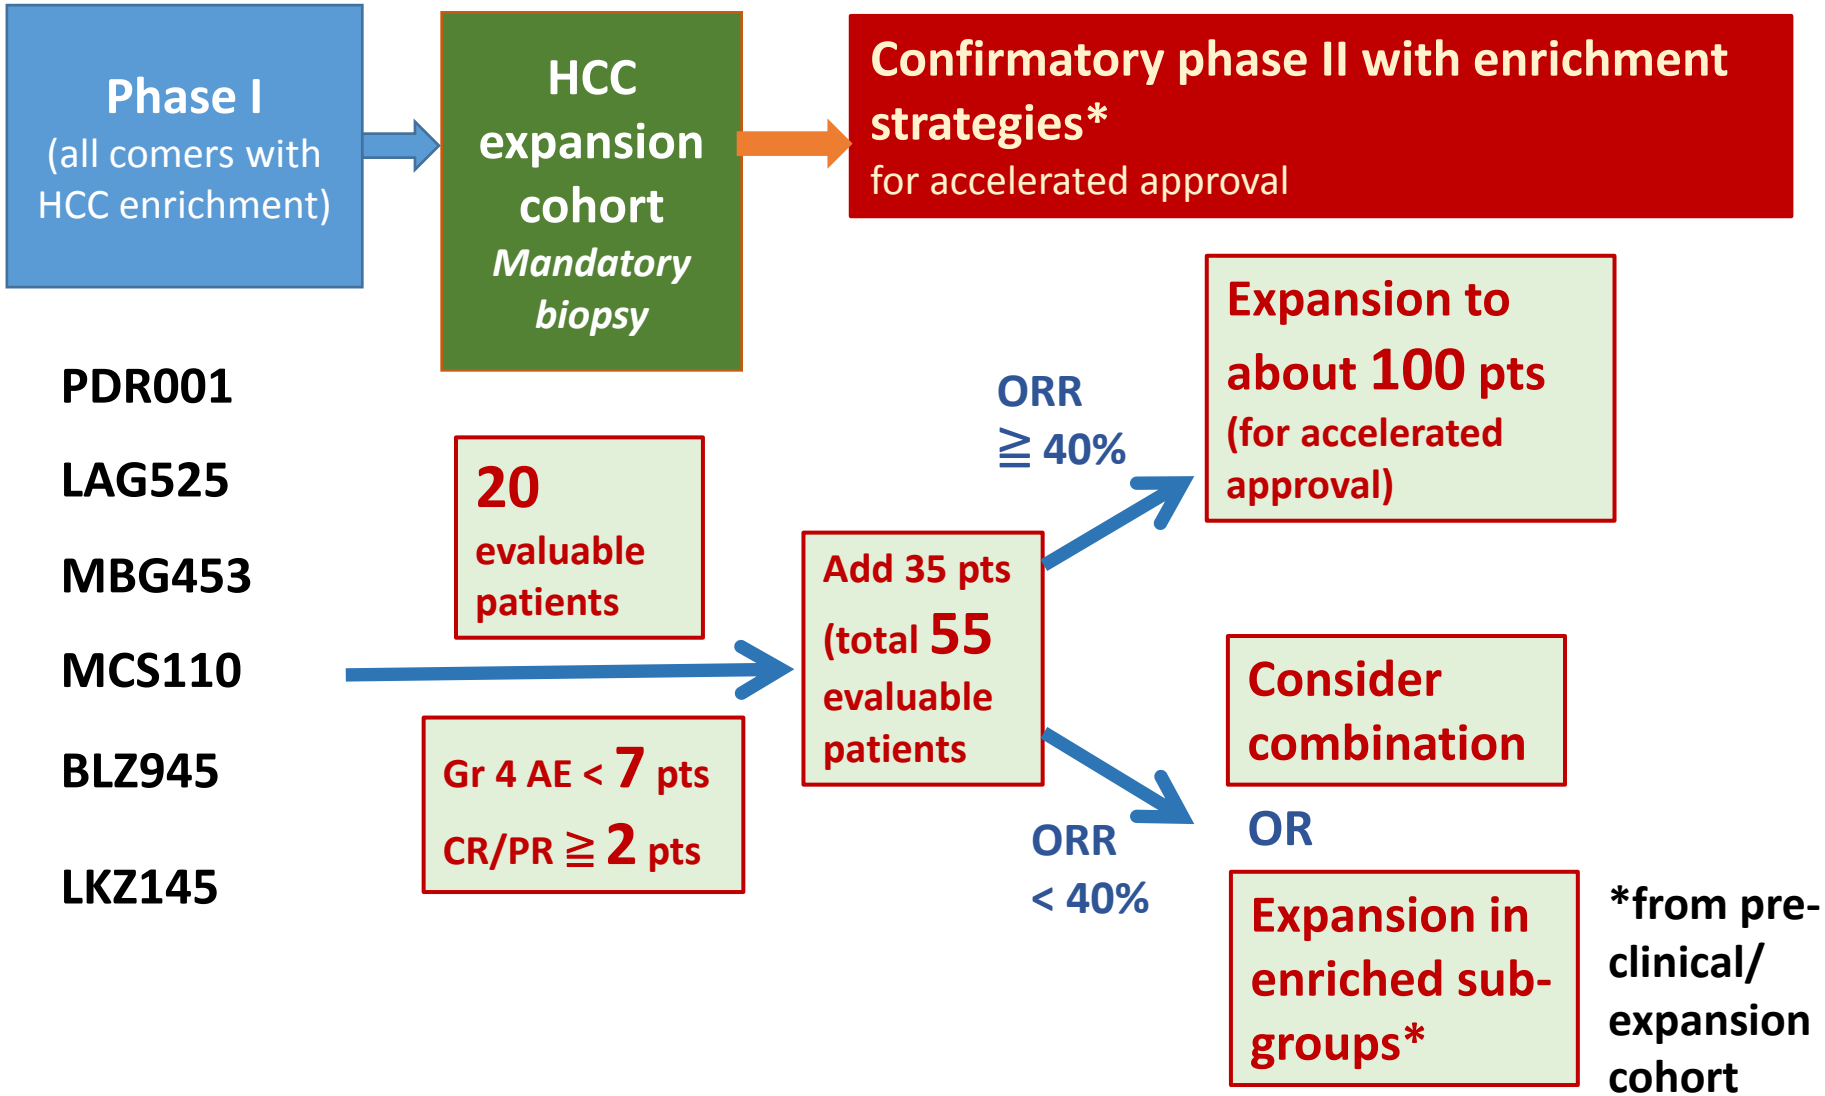
- The potential roles of PD-L2?
  - Yearley J et al. ESMO 2015 (
- Other immune cells in the micro-environment
  - TAM, MDSC
- Mutational loads
  - Melanoma, lung cancers, MMR deficient cancers
- Host immune response
  - Cytokines, No./function of T cell subpopulations
- Incorporation of genomic and immune profiling studies

Combination with other immune modulatory agents

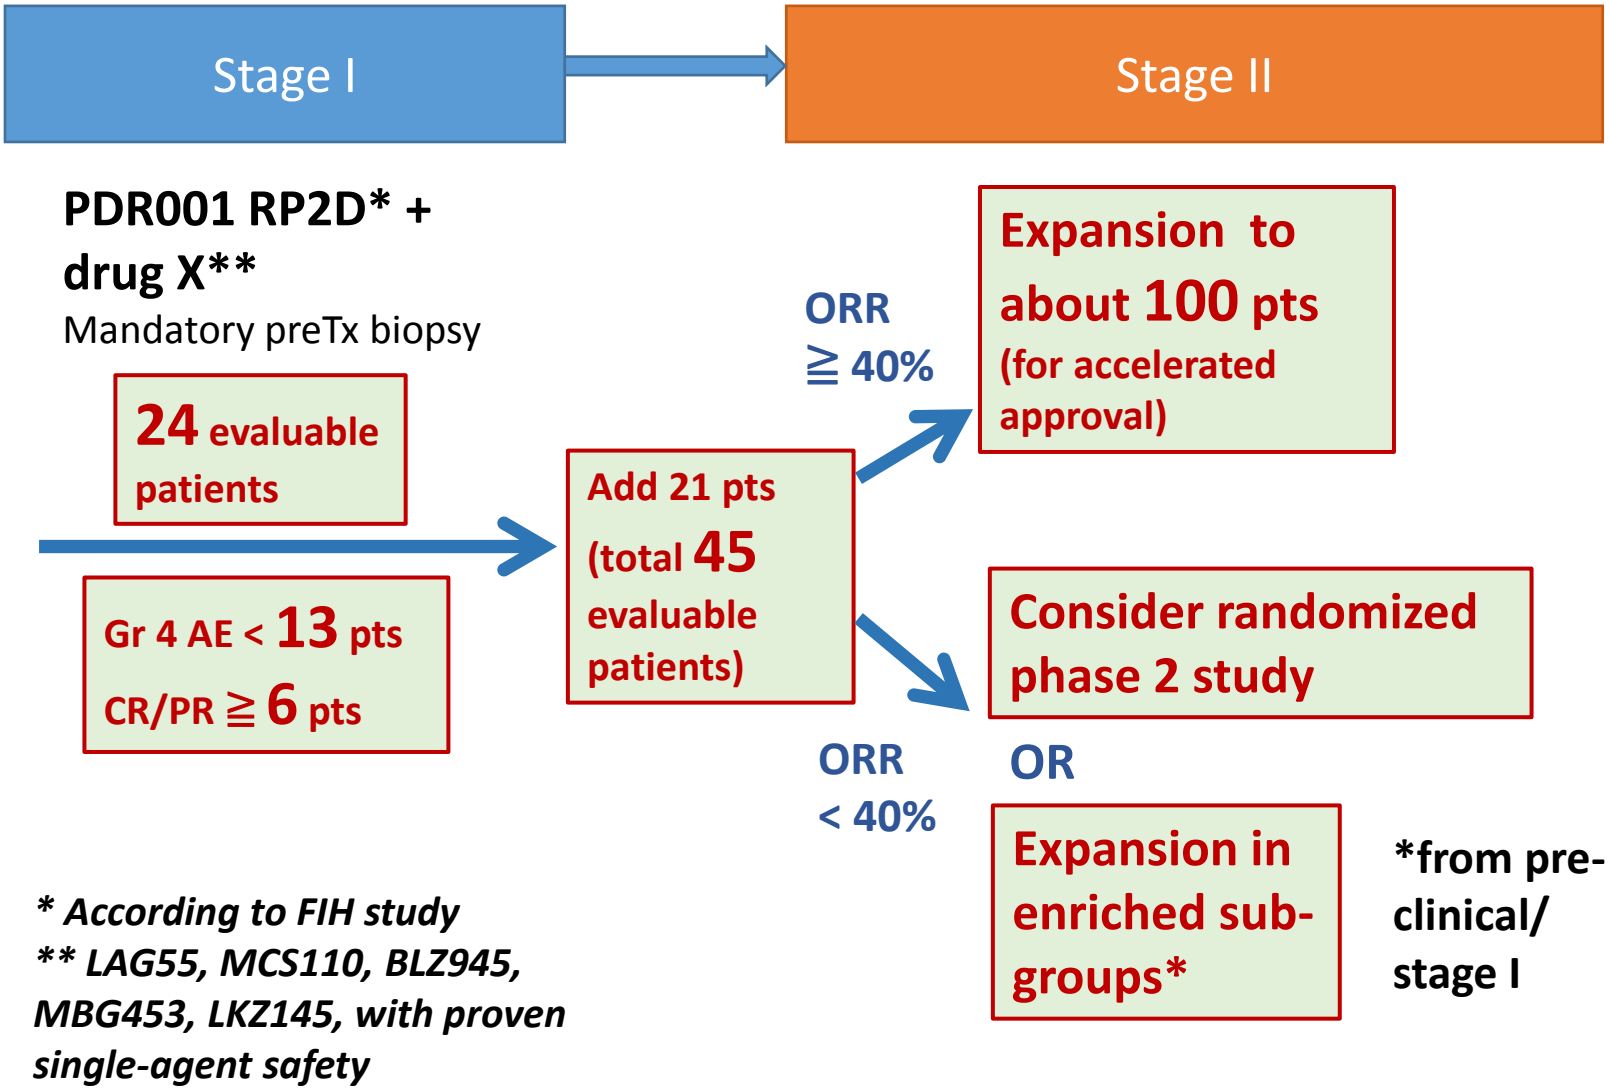
- **For TILs (+) tumors**
  - Combined with other checkpoint inhibitors (anti-LAG3, anti-TIM3, etc.)
  - Combined with co-stimulator agonists
  - Combined with inhibitors of TAM/MDSC (e.g., CSF-1Ri)
- **For TILs (-) tumors**
  - Combined with anti-CTLA4
  - Induction of immunogenic cell death (RT, chemo, MTT, etc.)
  - Improve T cell trafficking (e.g., anti-angiogenic)
  - CART
  - In situ vaccination

Back-up

Immunotherapy for advanced HCC (1): single agent

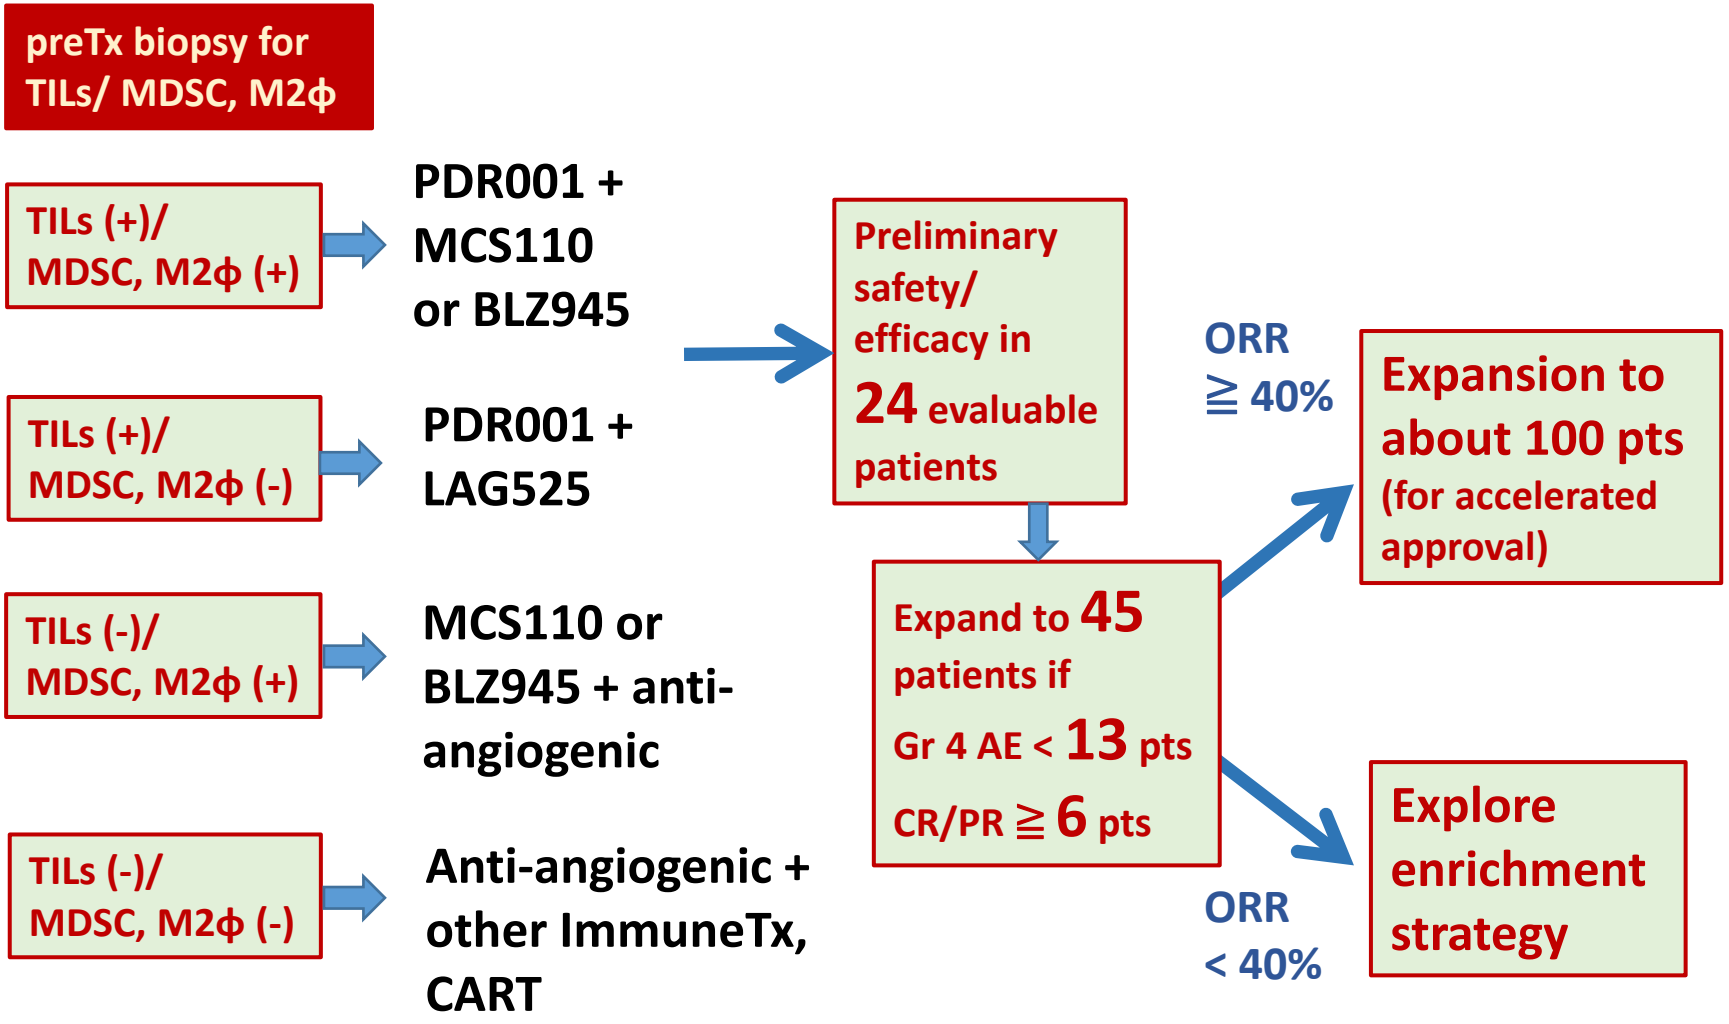


Immunotherapy for advanced HCC (2): PDR001 plus drug X combinations



** According to FIH study*
*** LAG55, MCS110, BLZ945, MBG453, LKZ145, with proven single-agent safety*

A ‘cluster’ protocol of immunotherapy for HCC



Potential partners of PDR001 (anti-PD1)

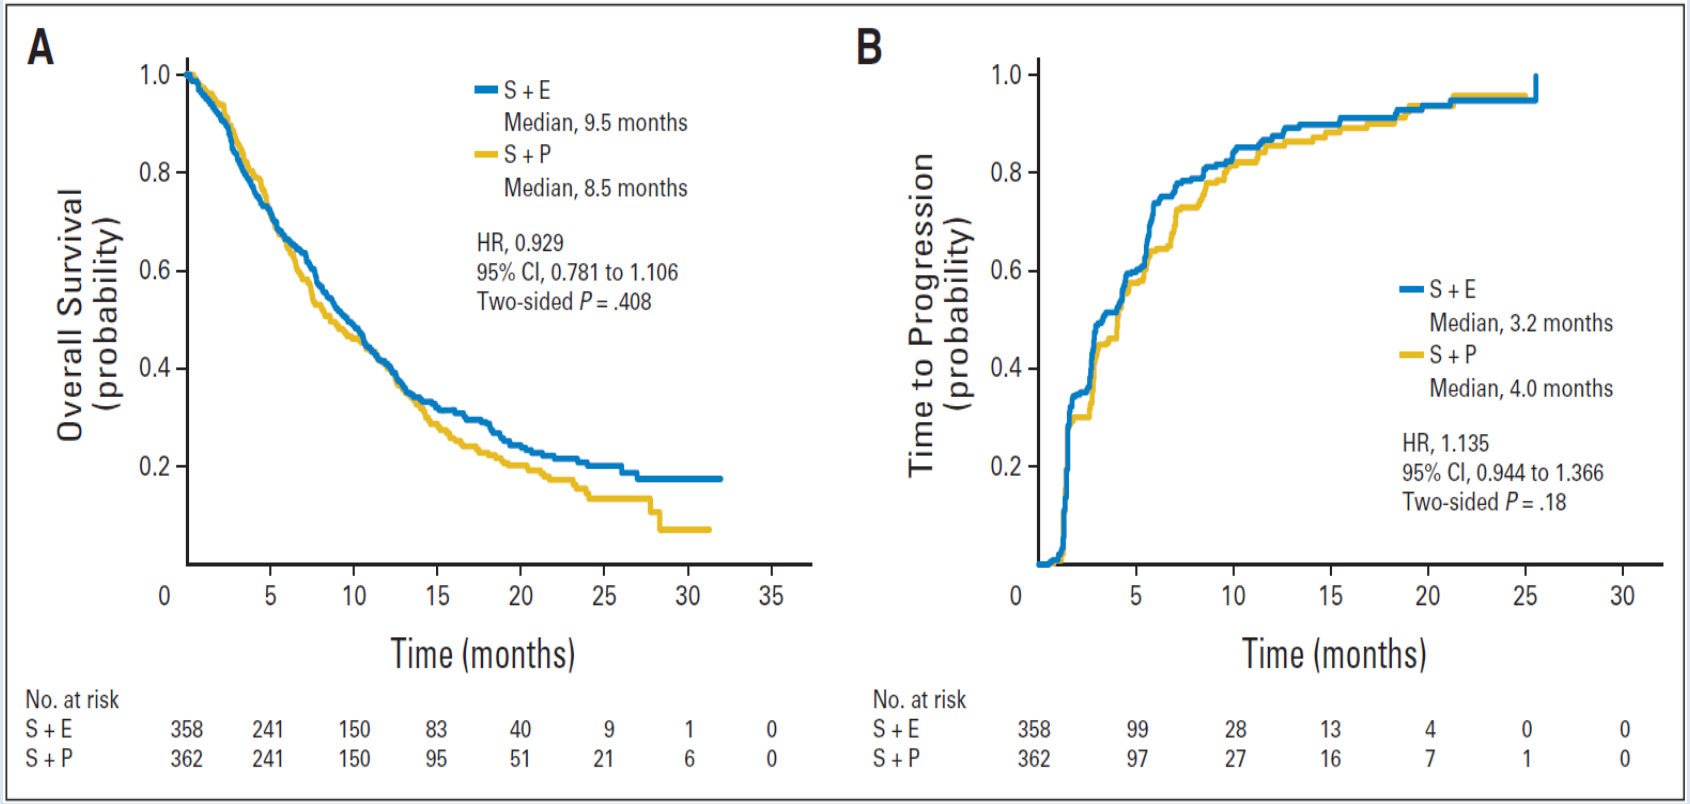
SEARCH: A Phase III, Randomized, Double-Blind, Placebo-Controlled Trial of Sorafenib Plus Erlotinib in Patients With Advanced HCC



Zhu A X. et al J Clin Oncol 2015;33:559-566

Why MTT fails in HCC ?

- New drugs for HCC have not shown significant activity. Phase II results were not solid enough to support Phase III trials.

- Failed to enrich biomarker subgroups for drug testing.

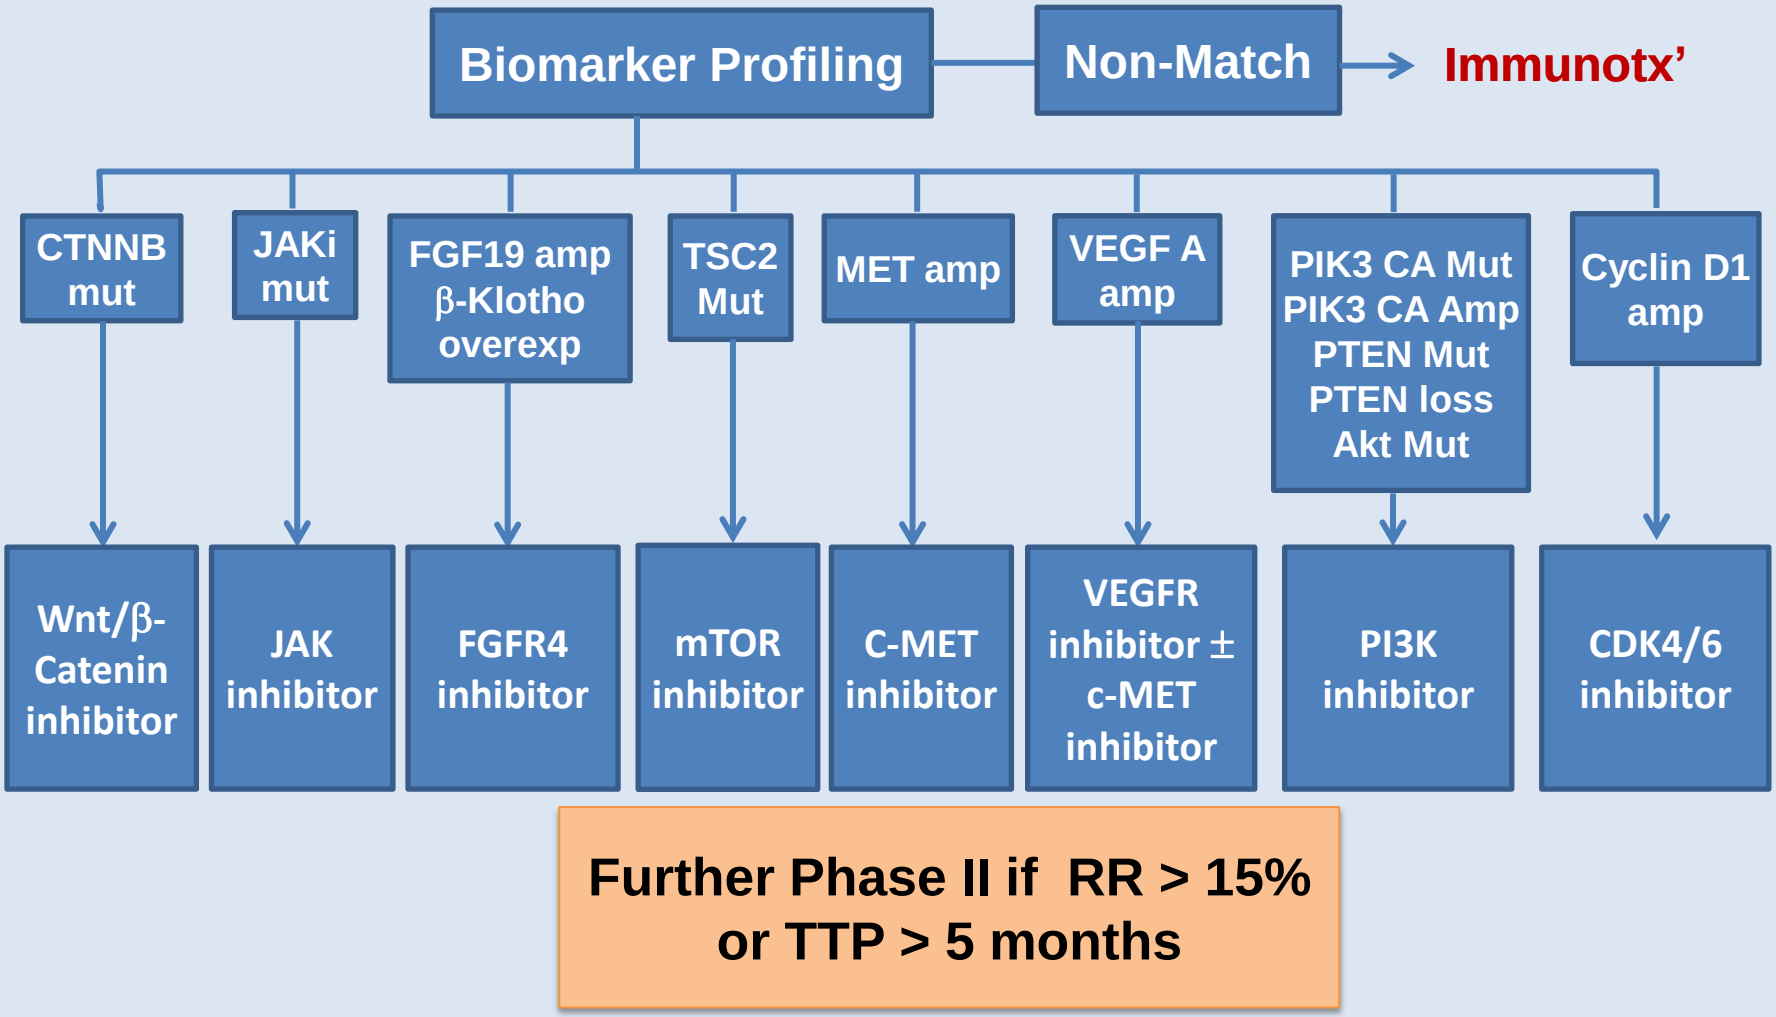
Basic Problems of Biomarker-Driven Clinical Trials in HCC

- Diagnosis of HCC does not routinely require histopathology. Biopsy is not without any risk.

Testing one drug for one biomarker at one time is painstaking, costly, and frustrating to patients and investigators.

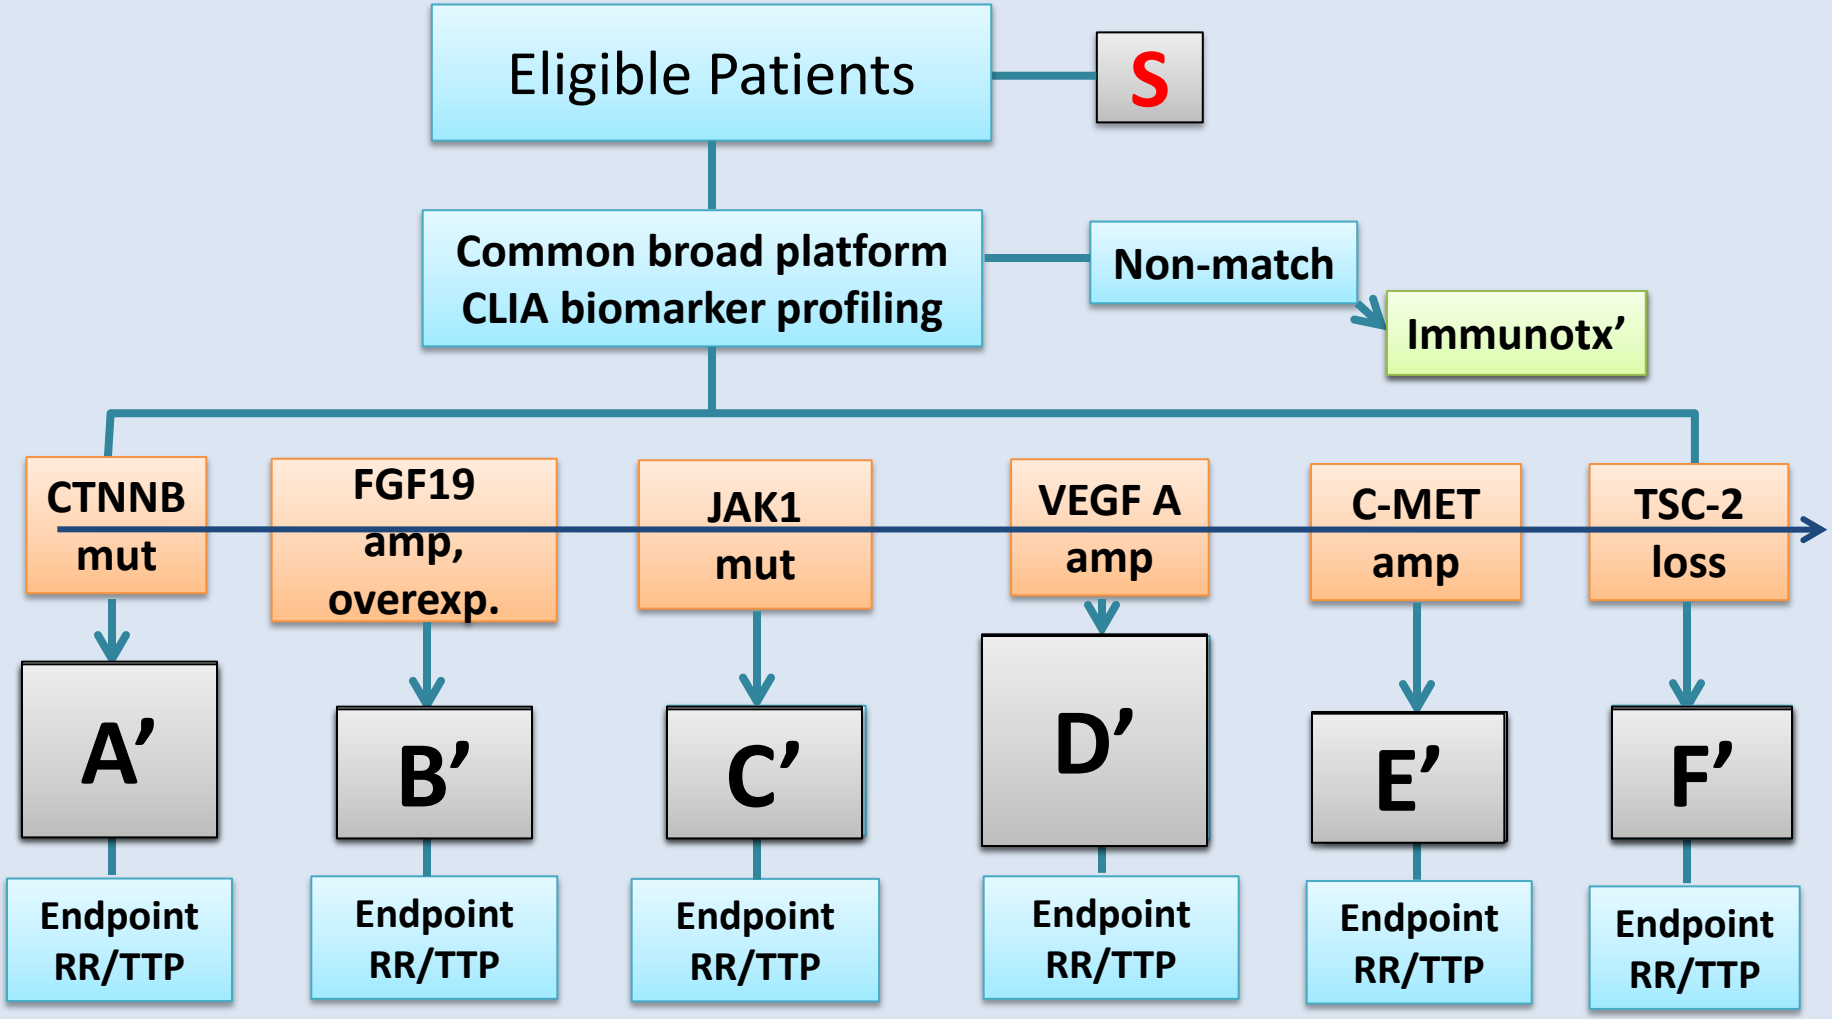
Master Protocol for 2nd-line HCC

- Exploratory, single-arm



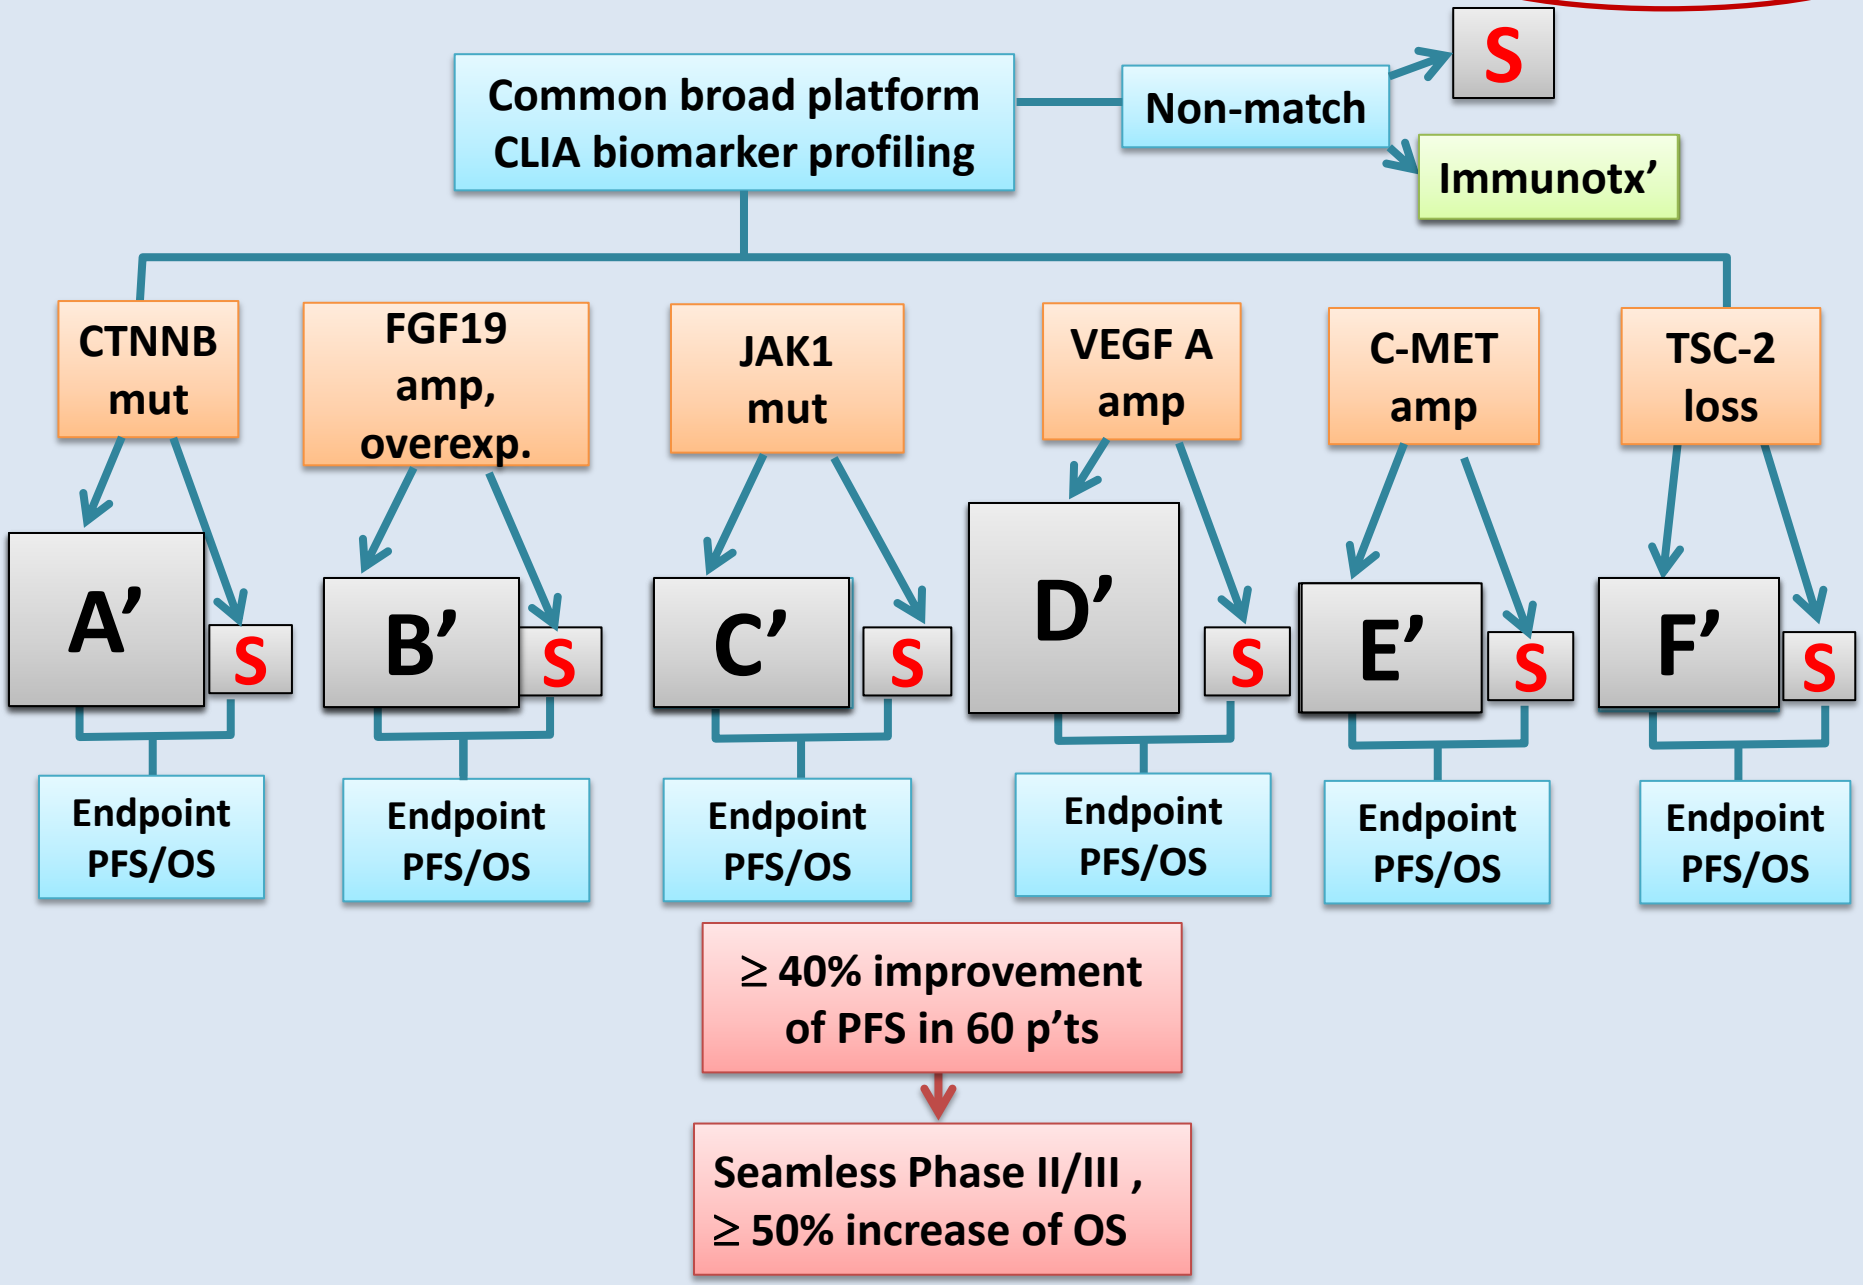
Further Phase II if RR > 15% or TTP > 5 months

Master Protocol for 1st-line HCC – Adaptive, Exploratory



Randomized phase II (vs sorafenib), if RR ≥ 25% or TTP ≥ 6 months.

Master Protocol for 1st-line HCC – Adaptive, confirmatory



Determine Molecular Subtypes for HCC – a daunting task

Clonality of Primary and Recurrent HCC

Year/Country/Journal	Methods	Different Clonality	Etiology

Combination of Immune Checkpoint Inhibitors and Cancer Antigen – Specific Immunotherapy

e.g. Anti-glypican 3 plus Anti-PDL1

SUMMARY

- HCC is the third leading cause of cancer death in the world. Global harmonization of etiology and epidemiology is expected to happen.
- NTUH has been leading drug development for HCC in the past 10 years.
- Many newly-discovered targets need to be tested, and biomarker-driven adaptive trials are under discussion.
- HCC is extremely heterogeneous, a fact that may jeopardize the determination of molecular subtypes. Liquid biopsy should be pursued.
- Immunotherapy for HCC has just begun, and looks promising.

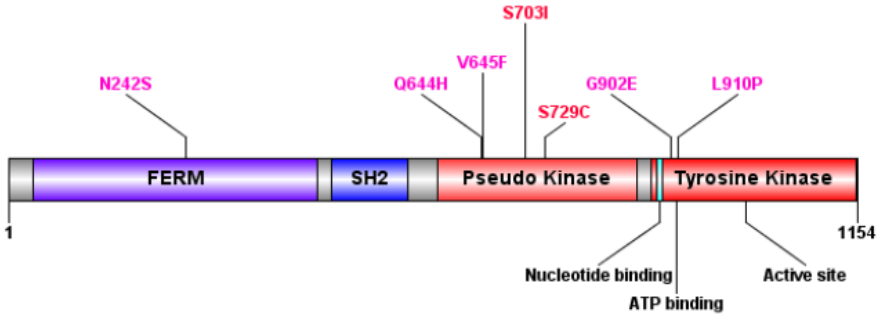
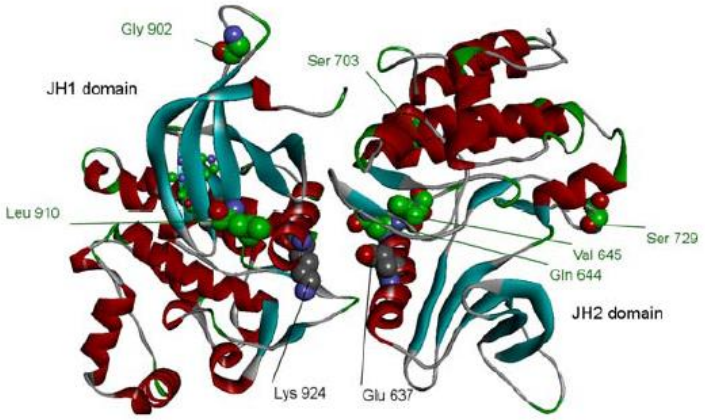
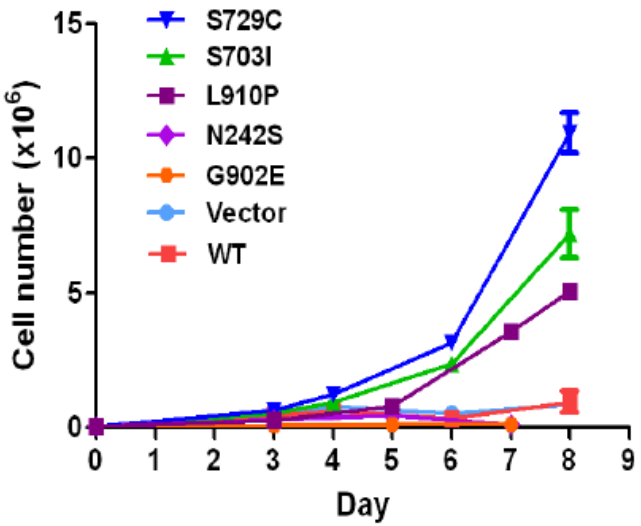
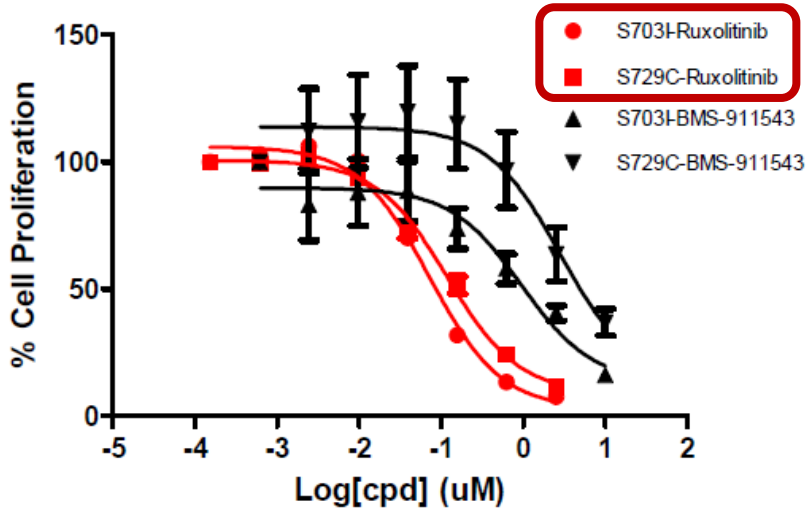
Activating mutations in JAK1









Kan Z, et al. Genome Res. 2013 Jun 20. [Epub ahead of print]

Activating JAK1-S703I Mutation May Predict the Sensitivity of JAK-STAT Inhibition in HCC Patient-derived Xenograft Tumor Model

- 4/60 PDX harbor JAK1 mutations.
- JAK1-S703I activates JAK-STAT pathway and drive cell proliferation.
- JAK1/2 inhibitor is modestly active in growth suppression.

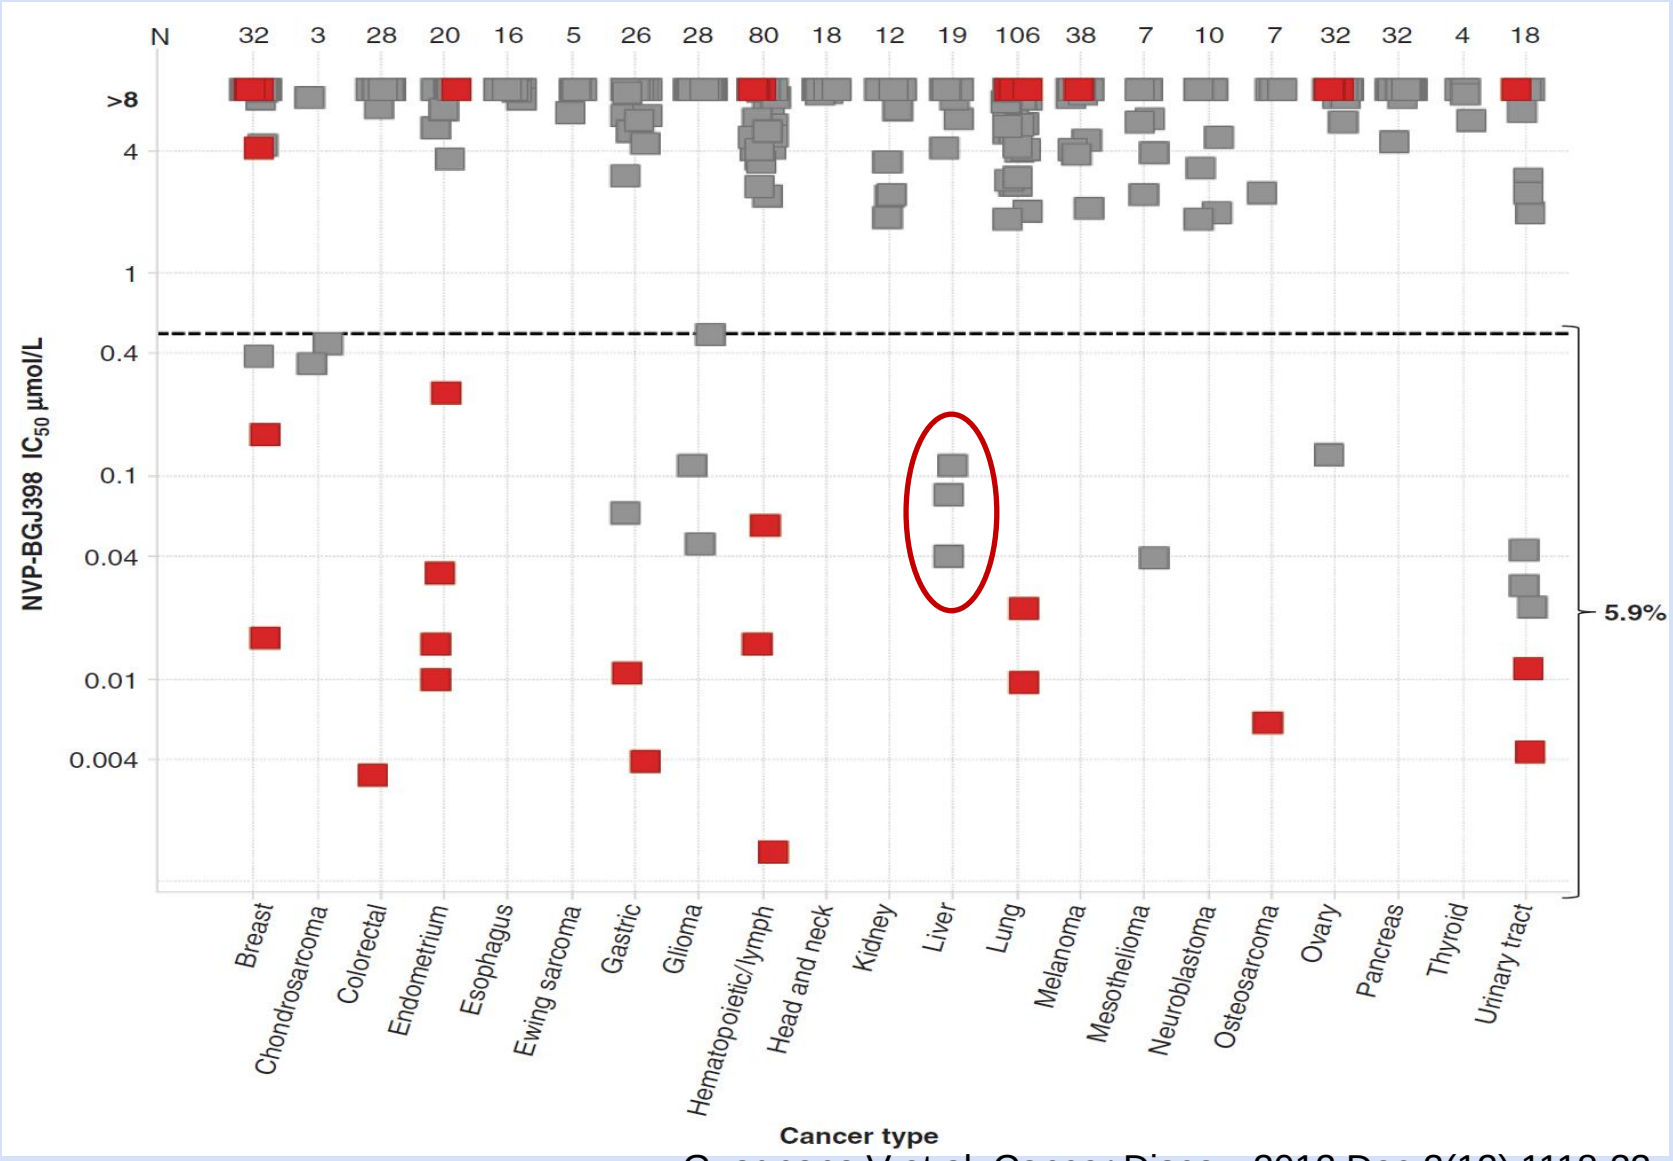
FGFR Genetic Alterations Predict for Sensitivity to NVP-BGJ398, a Selective Pan-FGFR Inhibitor



Guagnano V et al. Cancer Discov. 2012 Dec;2(12):1118-33

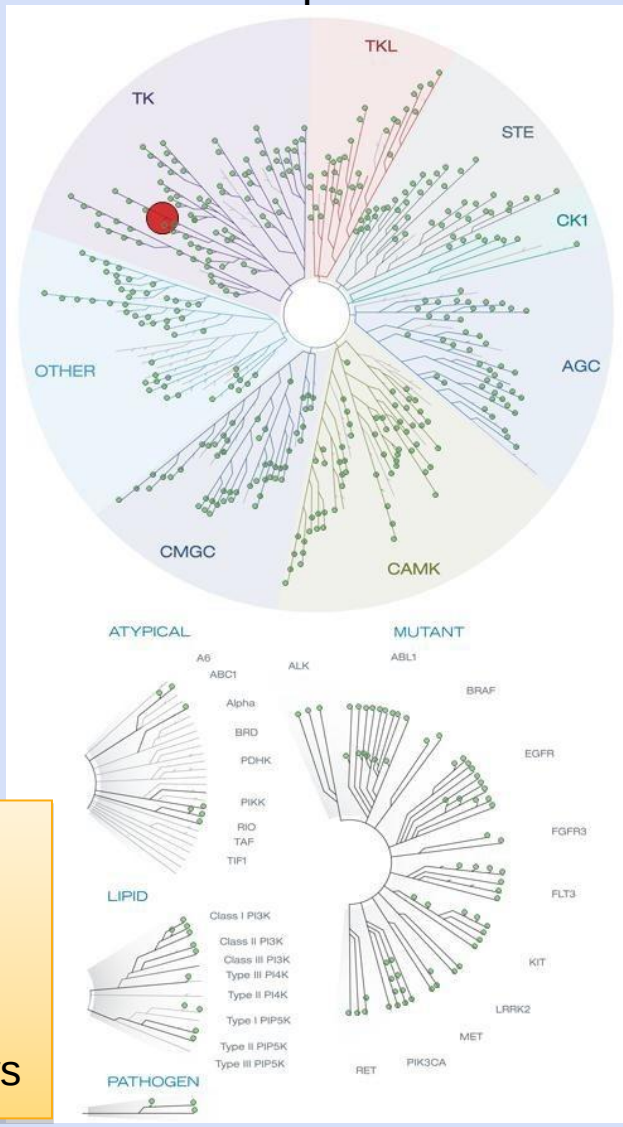
Novartis has a Highly Selective FGFR4 Inhibitor

Activity in FGF19/FGFR4/KLB cancer cell lines only

Biochemical assay	
Kinase	**IC50 µM**
FGFR1	>10
FGFR2	>10
FGFR3	>10
FGFR4	**0.0024**
auroraA	5.6
MK2	9.4
Others (59 kinases)	>10

Cellular assay	
BaF3 model	**IC50 µM**
BAF3/Tel-FGFR1	>10
BAF3/Tel-FGFR2	>10
BAF3/Tel-FGFR3	>10
BAF3/Tel-FGFR4	**0.0011**
Others (42 kinases)	>10

KINOMEscan: 456 kinases
FGFR4 inhibitor at 3 µM



Conclusions:

- FGFR4 inhibitor selectively binds the ATP site of FGFR4 in a kinome wide scan
- > 1,000-fold selectivity vs. panel of 65 kinases in biochemical assays
- > 1,000-fold selectivity vs. panel of 46 kinases in cellular assays

Predictive Biomarkers of Antiangiogenic Therapy for Advanced HCC

Table 2. Studies of predictive and prognostic markers, other than serum or plasma markers, for advanced HCC

	Authors	Treatment	Results		
			Predictive markers	Prognostic markers	Others
Tumor characteristics					
Phospho-ERK expression	Abou-Alfa et al. [71]	Sorafenib	High p-ERK → longer TTP	—	
	Ozenne et al. [72]	Sorafenib	No predictive value	—	
Phospho-c-Jun expression	Hagiwara et al. [73]	Sorafenib	Phospho-c-Jun expression → poor response, TTP	Phospho-c-Jun expression → poor OS	

Shao YY, et al. Liver Cancer 2013;2:93–107

Predictive Biomarkers of Antiangiogenic Therapy for Advanced HCC

Functional imaging					
DCE-MRI	Hsu et al. [75]	Sorafenib plus UFT	High baseline K^{trans} or decreased K^{trans} after treatment→ DCR	Vascular response[a] → better OS	Vascular response[a] → better PFS
Positron emission tomography	Lee et al. [83]	Sorafenib	—	Low SUV → better OS	Low SUV → better PFS
Treatment side effects					
Hypertension	Estfan et al. [87]	Sorafenib	Hypertension → better TTP (?)[b]	Hypertension → better OS	
	Otsuka et al. [88]	Sorafenib	No predictive value	No prognostic value	
Skin toxicity	Otsuka et al. [88]	Sorafenib	No predictive value	Skin toxicity → better OS	
	Vincenzi et al. [89]	Sorafenib	Early[c] skin toxicitiy → better DCR and TTP	Early skin toxicity → better OS[d]	

a=defined as ≥ 40% decrease in K^{trans} after treatment; b=statistical values of the comparison not reported; c=within the first month of treatment; d=borderline statistical significance.

Drug development for Squamous NSCLC

- Many possible biomarkers and many potentially active drugs.

However, testing one drug for one biomarker at one time is painstaking, costly, and frustrating to patients and investigators.

Landscape of the Most Prevalent Mutations and High-Level Gene Amplifications in Human HCC

Gene	Pathways/Gene Functions Involved	Estimated Frequency Based on Deep-Sequencing Studies (%)
Driver Genes Frequently Mutated in HCC		
TERT promoter	telomere stability	60
TP53	genome integrity	20–30
CTNNB1	WNT signaling	15–25
ARID1A	chromatin remodeling	10–16
TTN	chromosome segregation	4–10
NFE2L2	oxidative stress	6–10
JAK1	JAK/STAT signaling	0–9
Oncogenes/Tumor Suppressors Rarely Mutated in HCC		
IDH1, IDH2	NAPDH metabolism	<5
EGFR	growth factor signaling	<5
BRAF	RAS/MAPK signaling	<5
KRAS, NRAS	RAS/MAPK signaling	<5
PIK3CA	AKT signaling	<5
PTEN	AKT signaling	<5
Oncogenes Contained in High-Level Amplifications in HCC		
FGF19	FGF signaling	5–10
CCND1	cell cycle	5–10
VEGFA	HGF signaling/angiogenesis	7–10

Time Has Come to Raise the Bar in Oncology Trials

Oncology clinical trials are at crossroads,…..

There is a need to completely re-envision what a clinical trial looks like, including the mandatory use of “- omics”, and “adaptive design” enabled by high-functioing systems and processes.

Dilts DM, J Clin Oncol 2014;32:1186

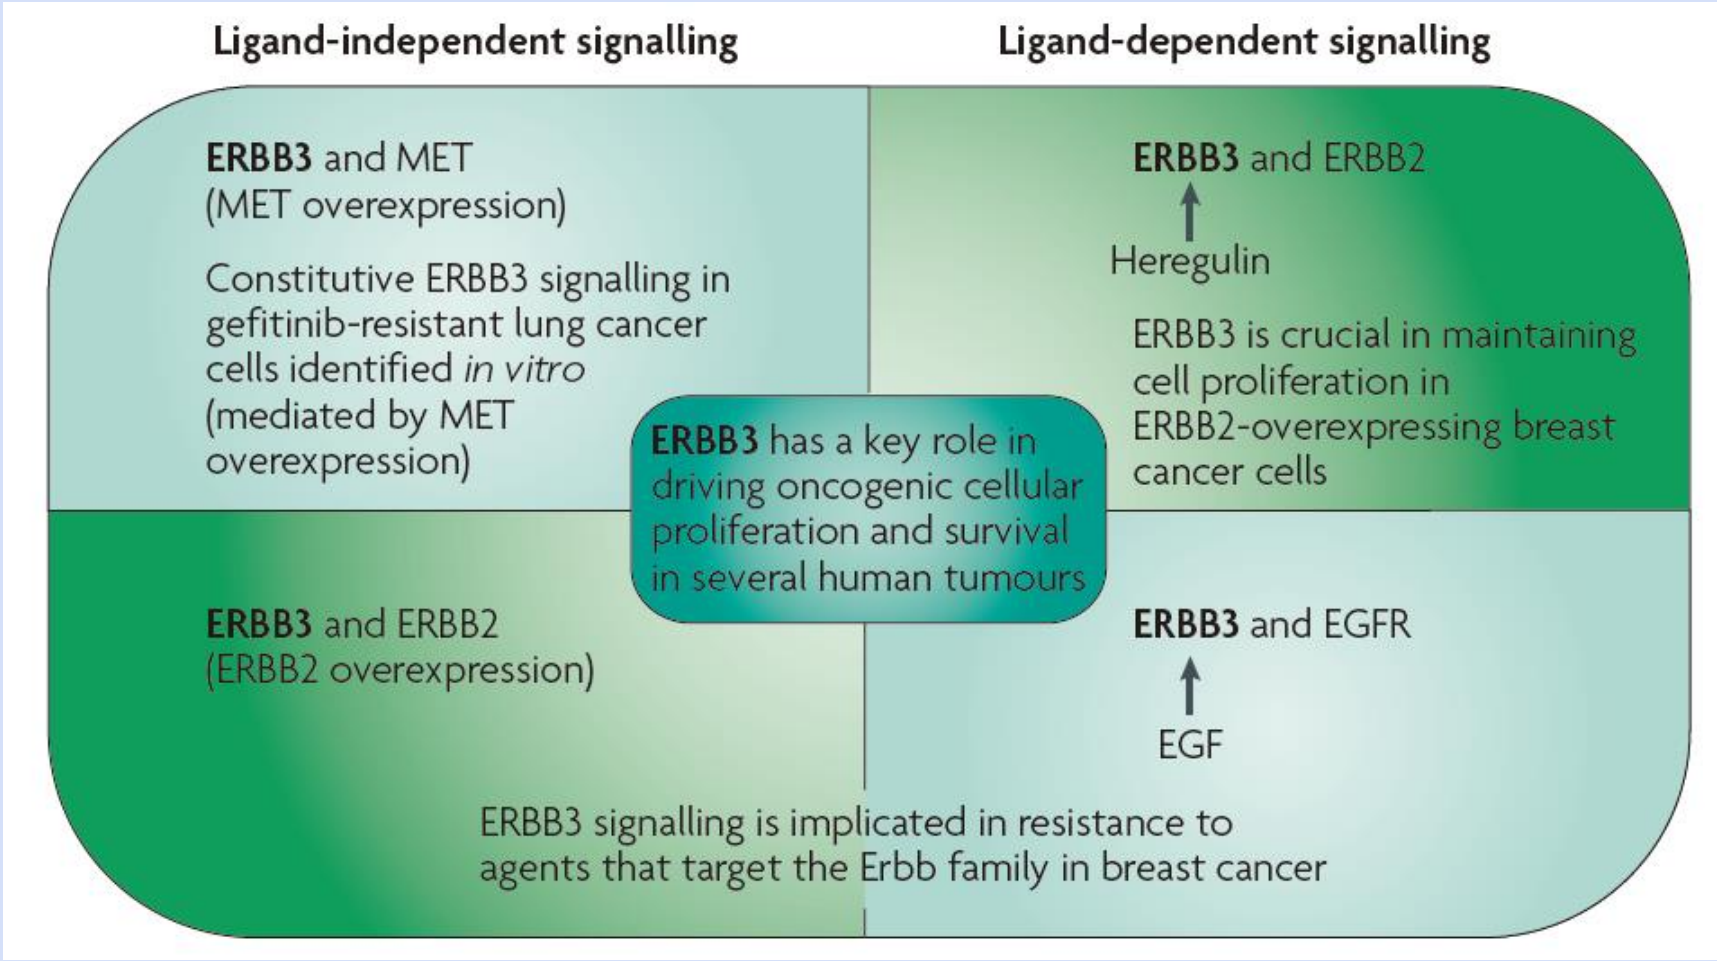
New Targets for HCC

- Wnt/β-Catenin
- JAK/STAT
- FGF19/FGFR4
- VEGF-A
- c-MET
- TSC-2

CONCLUSIONS

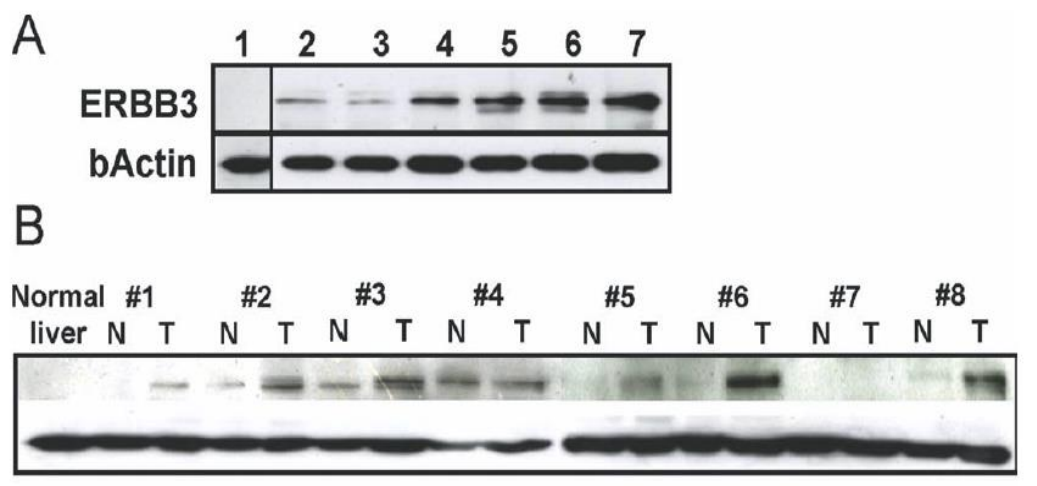
1. **Biomarker-driven adaptive trials, testing multi-drugs in multi-arms are possible in HCC.**
2. **“Super-adaptive” design of trials may help expedite drug development in HCC.**
3. **A disinterested organization that works with multiple companies, and provides the logistic support for a big data-managing operation is mandatory – These problems can be solved by a single- or oligo-company study.**
4. **Regulatory approval may be a problem, but can be solved by conducting the study in a single/oligo, well-experienced countries.**

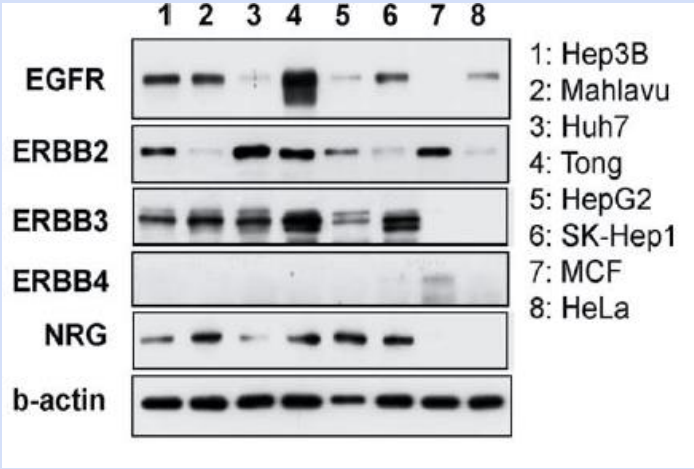
The Central Role of HER-3



~ Baselga J & Swain SM: Nature Rev Cancer 2009; 9 463.

Neuregulin/HER3 Autocrine Loop Contributes to Invasion and Early Recurrence of Human HCC





- HER-3 overexpression associated with intra-hepatic metastasis, recurrence, and poor prognosis

~ Hsieh SY et al: Hepatol 2011; 53: 504.

(A) Immunoblotting of HER-3: Lane 1, normal liver tissue; 2, Huh7; 3, HepG2; 4, Mahlavu; 5, SK-Hep1; 6, Tong; 7, and Hep3B. By real-time qRT-PCR, the overexpression of HER-3 in HCC compared to non-tumor part (2 fold-elevation) was seen in 50/71 HCC patients (~ 70%).

Liver Cancer:

- **Sixth most common cancer worldwide[1]**
- **Third most common cause of cancer-related death[2]**

Whole-genome Sequencing of Liver Cancers Identifies Etiological Influences on Mutation Patterns and Recurrent Mutations in Chromatin Regulators

Table 1 Significantly mutated genes and their mutation frequency in the validation set

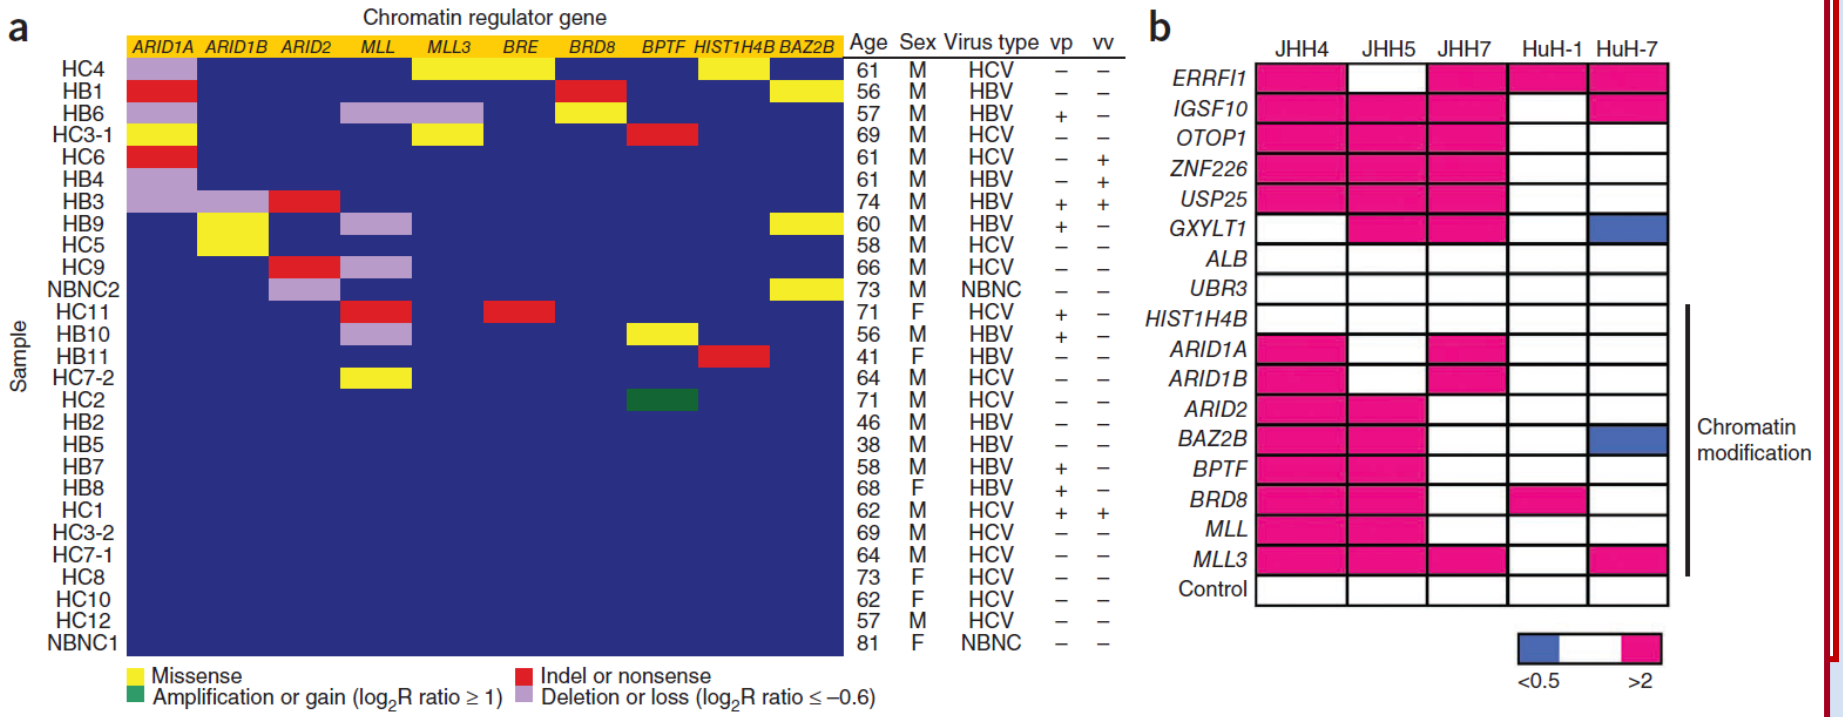

Figure 4 Mutations in chromatin regulators and functional analysis of potential driver genes. (**a**) Mutations in chromatin regulators in 27 HCC genomes. Mutations in chromatin-regulator genes are summarized. In addition to point mutations, 55.6-kb genomic deletion of *ARID2* in NBNC2, which was identified by the read-pair method, and several copy-number alternations of chromatin-regulator genes are included. HC6 had both 1-bp deletion and low-level loss in *ARID1A*. (**b**) Functional assays of potential driver genes in HCC cell lines. Changes in cell proliferation in five HCCs compared to proliferation with control siRNA treatment are presented. Magenta and blue boxes represent more than 2-fold and less than 0.5-fold changes in the cell number, respectively. Genes involved in chromatin modification are indicated by the line.

Overall responses	10.5% (95% CI = 3.9 to 16.9%)	20.9% (95% CI = 12.5 to 29.2%)	.058
Median overall survival (mo.) based on intent-to-treat	6.83 (95% CI = 4.80 to 9.56)	8.67 (95% CI = 6.36 to 12.00)	.830

Yeo W, et al. J Natl Cancer Inst 2005;97:1532 – 8

Table 3. Toxicity profiles by treatment arm*

Toxicities	Doxorubicin arm		PIAF arm		*P* value†
	N	%	N	%	
Neutropenia	59	63	77	82	.003
Thrombocytopenia	23	24	54	57	<.001
Anemia	26	28	26	28	1.000
Febrile neutropenia	16	17	12	12	.412
Raised hepatic transaminase	12	13	16	17	.413
Hyperbilirubinaemia	15	16	12	13	.533
Diarrhea	7	7	11	12	.322
Vomiting	4	4	11	12	.059
Stomatitis	7	7	3	3	.193
Anorexia	3	3	7	7	.193
Abdominal pain	6	6	3	3	.305
Alkaline phosphatase	7	7	5	5	.550
Malena/gastrointestinal bleeding	5	5	5	5	1.000
Hypokalemia	0	0	7	7	.007
Hyponatremia	1	1	6	6	.054
Nausea	4	4	2	2	.406
Treatment-related mortality	3	3	8	9	.194

APASL Guideline : Chemotherapy/New drugs

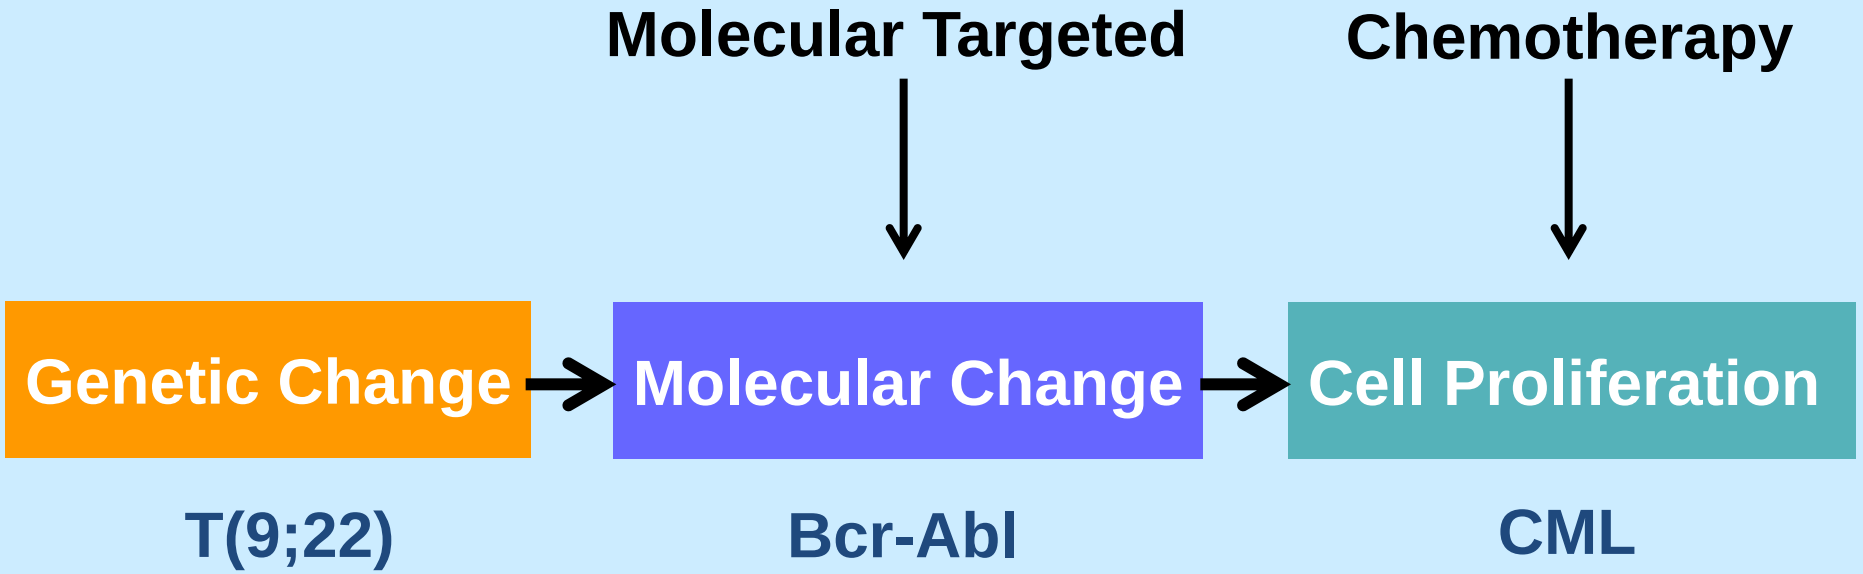
Recommendation (3)

- Cytotoxic therapy, such as anthracyclines, platinums, fluoropyrimidines, and gemcitabine, are not routinely recommended, but can possibly be considered in highly selected patients whose general and hepatic conditions are adequate, so as to minimize treatment-related toxicity. (Grade C)

Imatinib for Chronic Myeloid Leukemia

– An ideal example of molecular targeted therapy

- T (9;22) → Bcr-Abl → CML
- Bcr-Abl, a protein absent in normal cells
- Imatinib binds to Bcr-Abl and abolish its kinase activity



Molecular Targeted
Chemotherapy

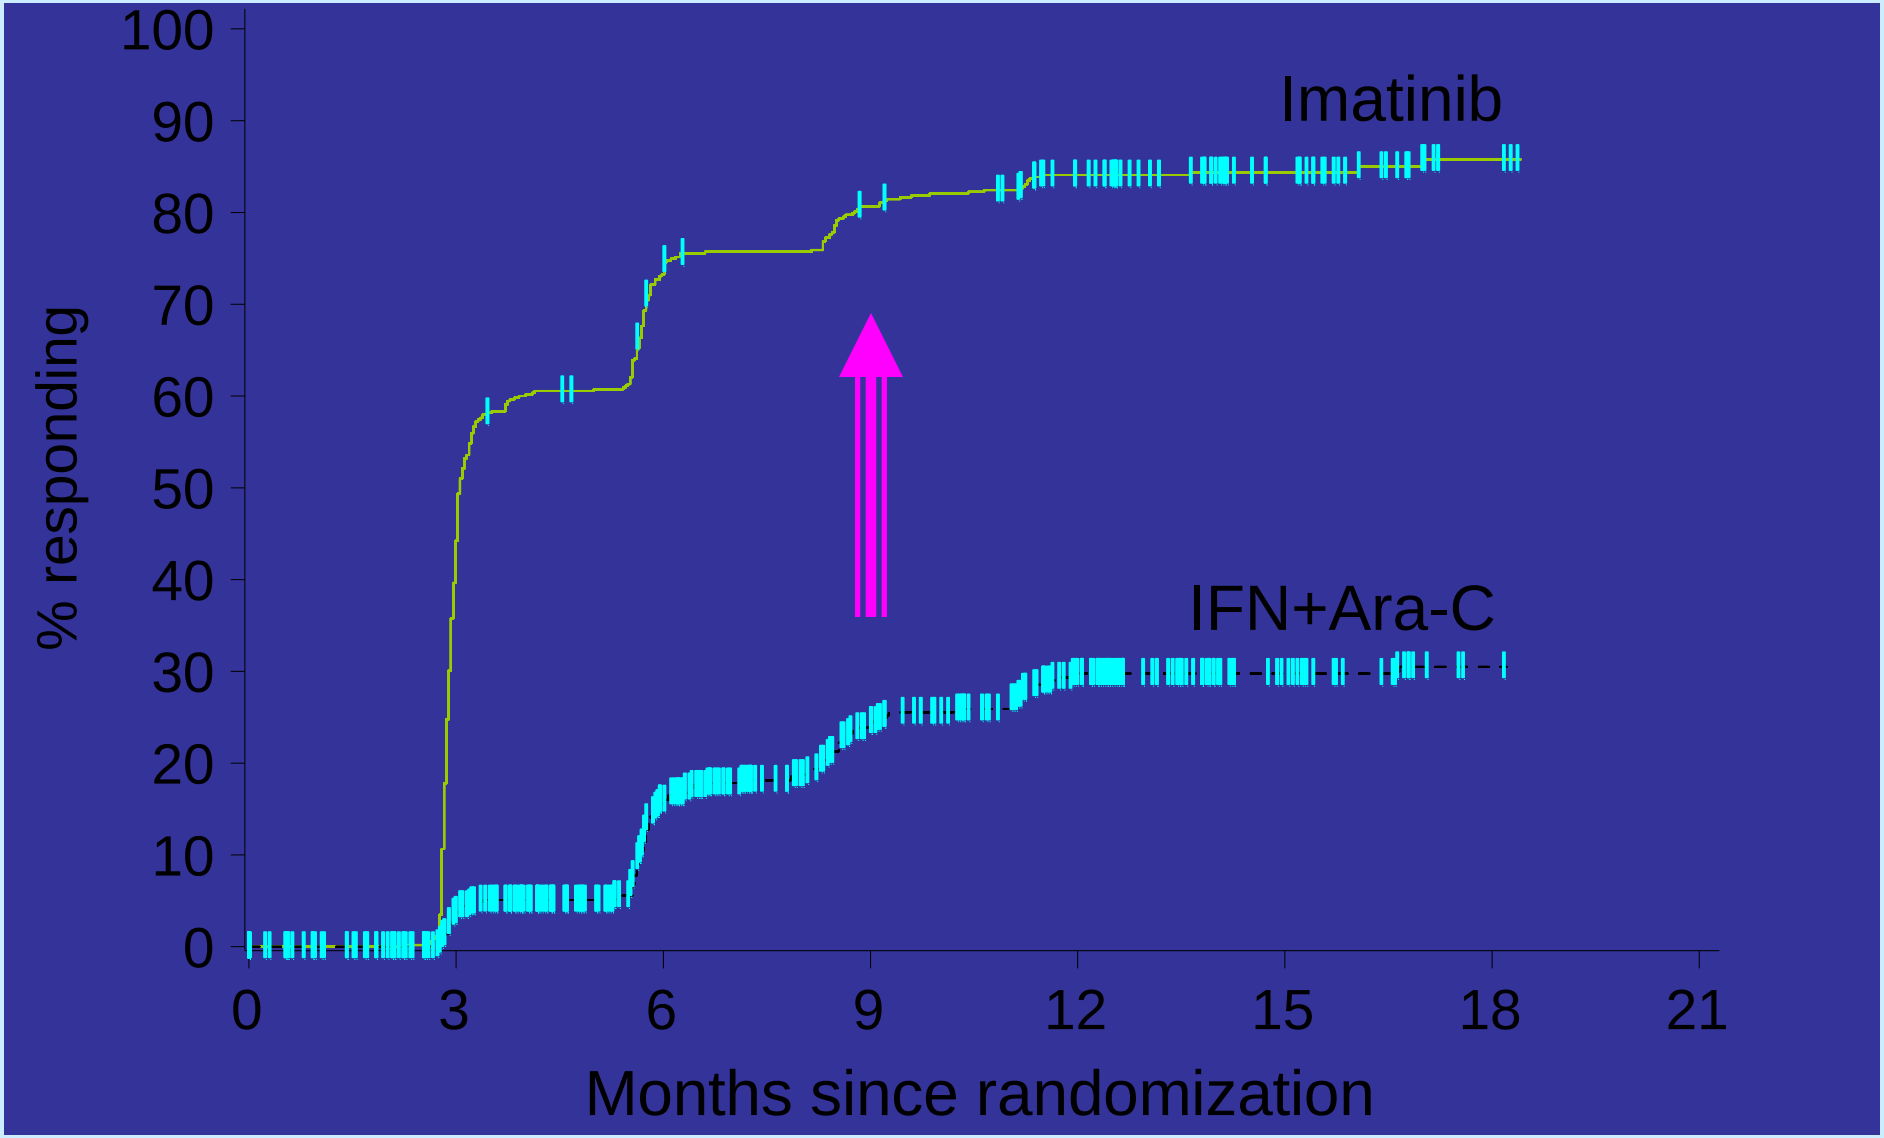
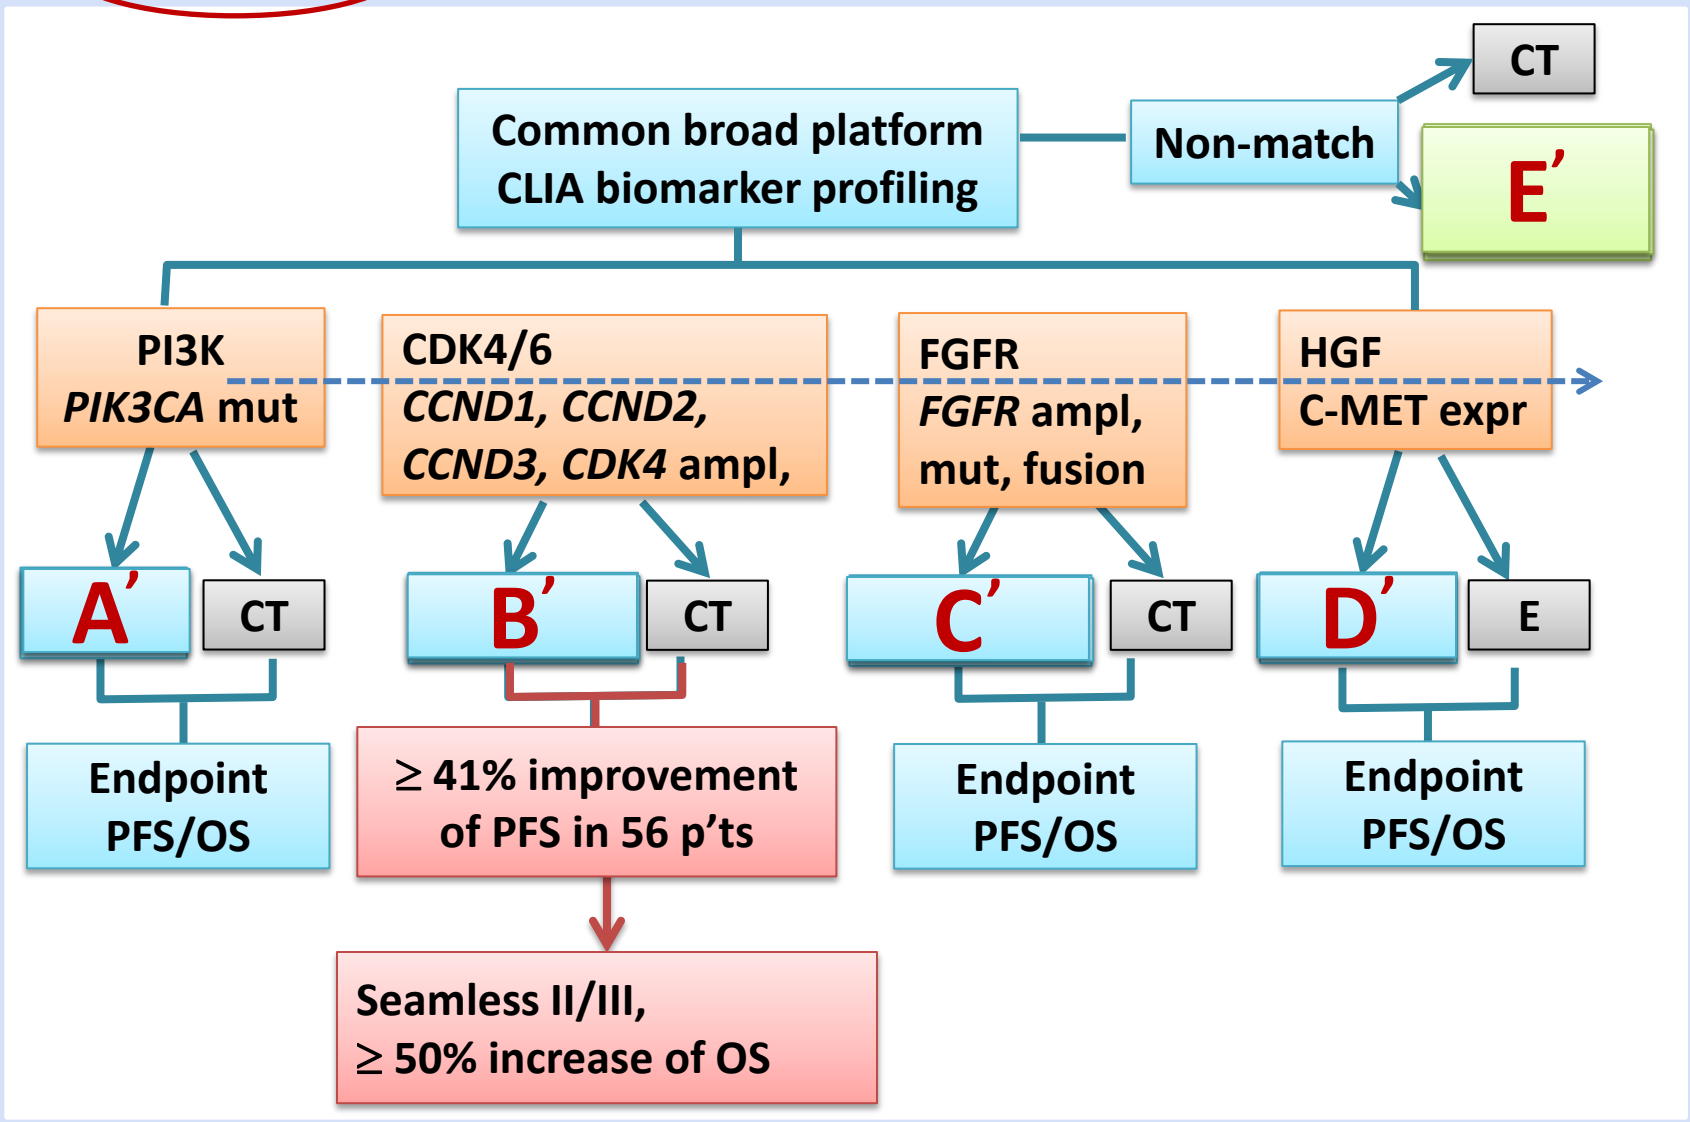
Major Cytogenetic Responses



Druker et al. NEJM 2006; 355 (23): 2408

US Master Protocol for 2nd-line Squamous NSCLC

- Confirmatory, seamless phase II/III for approval



Cancer Discovery March 2014

"Super-adaptive" Master Protocol

- Biomarker-driven, multi-arm, multi-drug.
- Drop the losers, add newcomers, and push forward winners.
- A trial that is "living" and "growing".

Synergism of Anti-CTLA4 and Anti-PD1

- Simultaneous activity on effector T cells.

- Anti-PD1 restores the function of exhausted T cells (high PD-1 expression after chronic immune activation) and Anti-CTLA4 suppresses Treg.

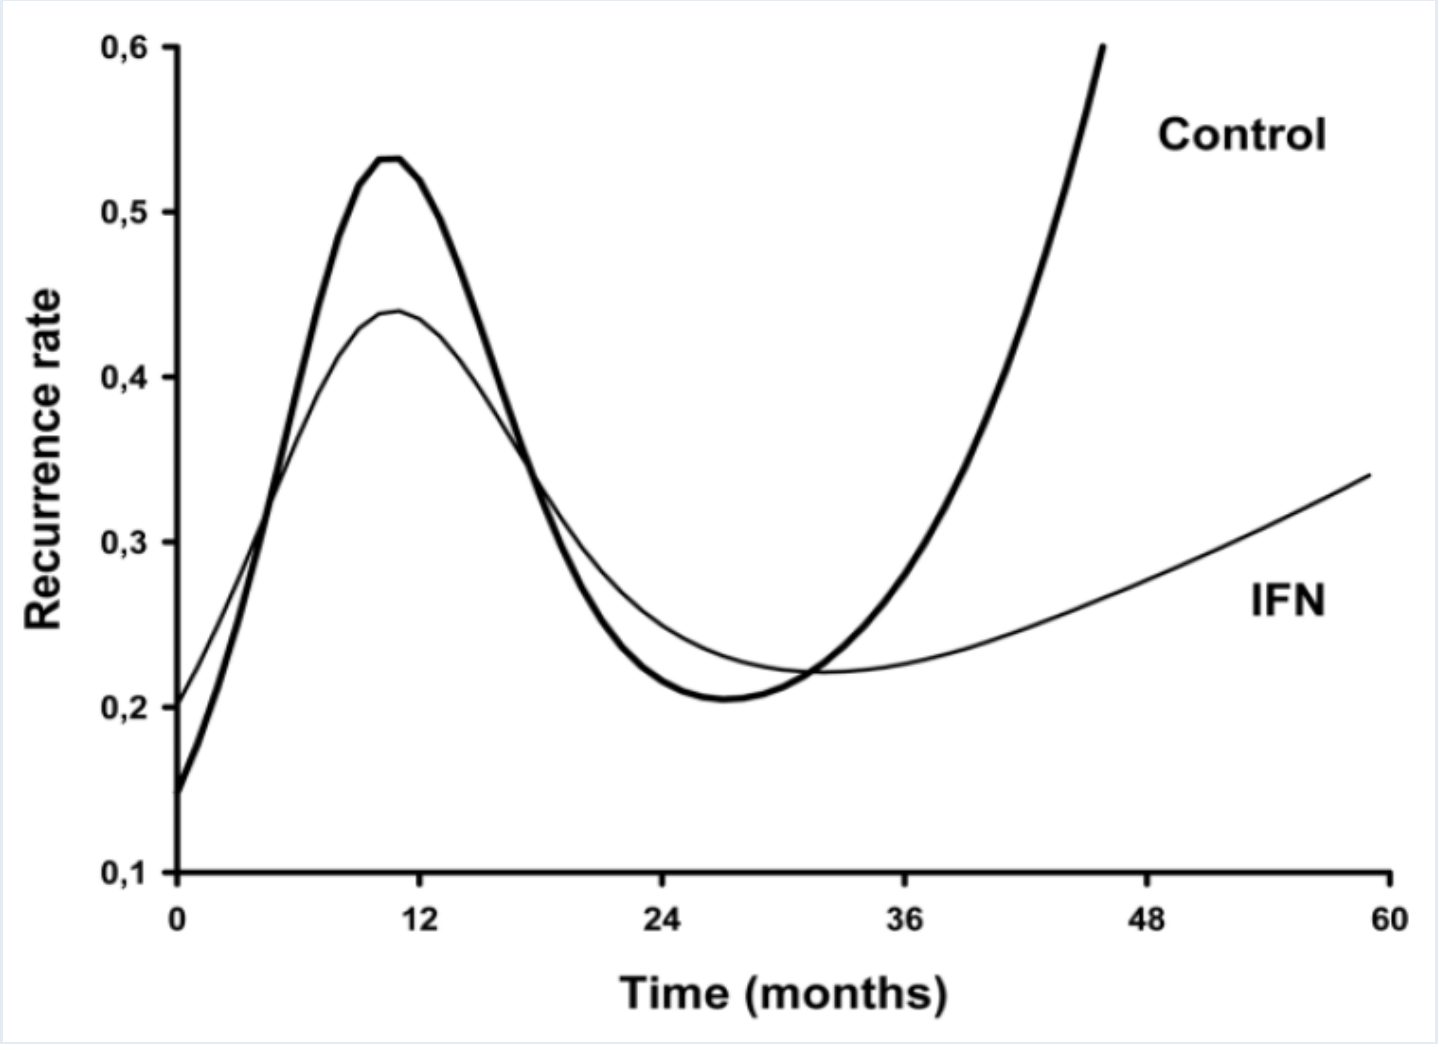
Notable ongoings:

Lenvatinib – phase III, 1st-line (vs sorafenib)
Tivantinib – phase III, 2nd-line (c-met enriched)
Cabozantinib – phase III, 2nd-line
Regorafenib – phase III, 2nd-line

Half of recurrent HCC are second primary tumor. Therefore, archived tissues of the primary tumors may not be adequate enough to determine molecular subtypes of recurrent tumors which are under treatment.

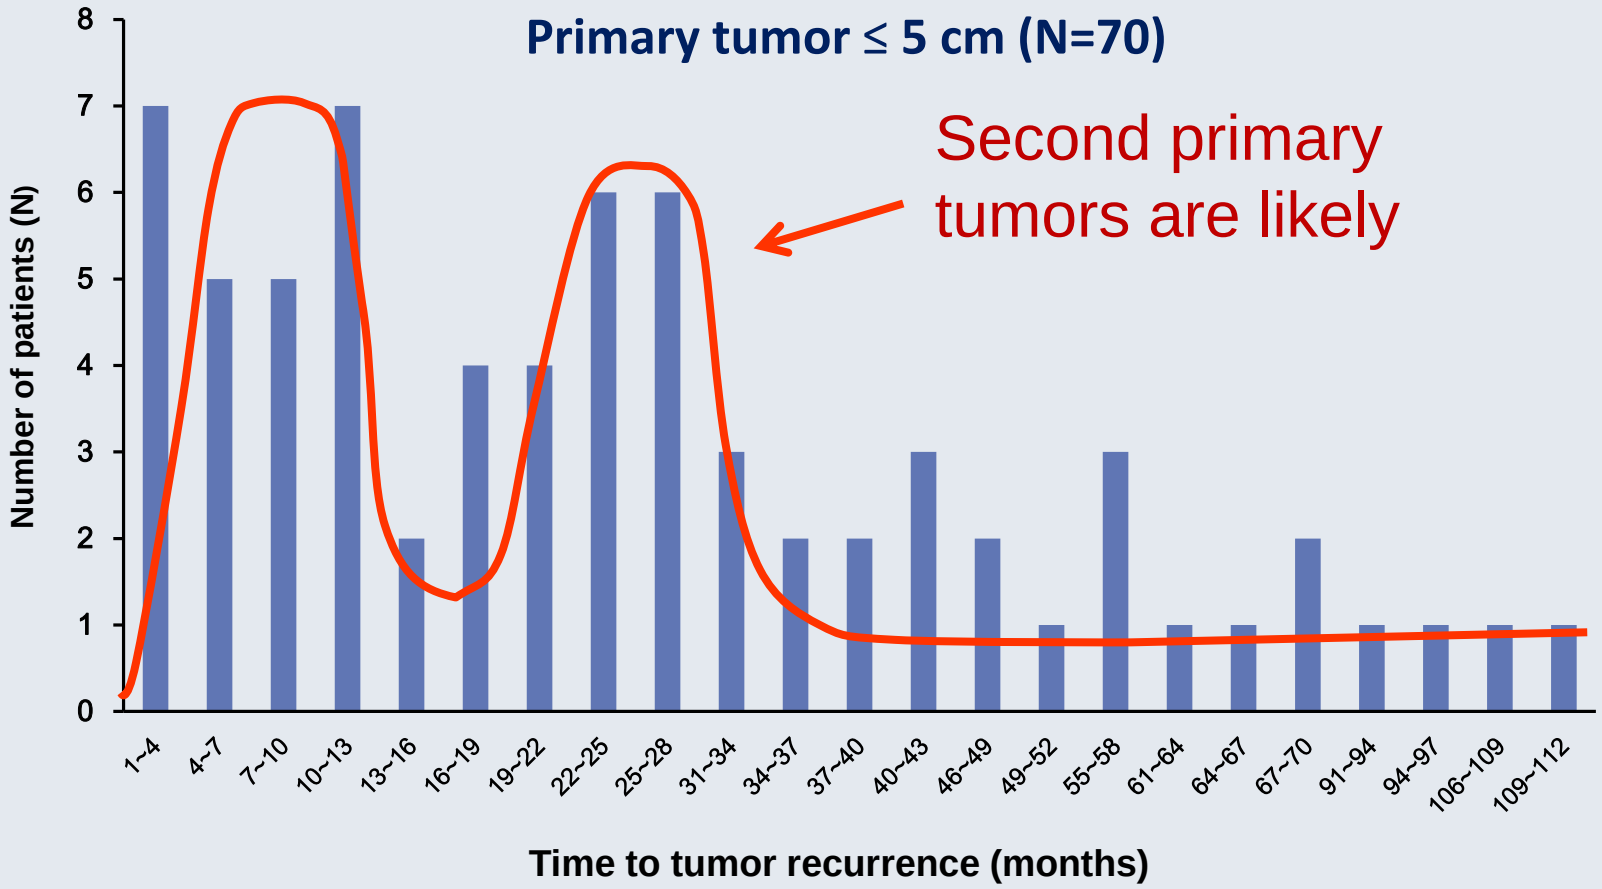
Fresh biopsy is always preferred, but HCC is unique in that tissue diagnosis is not routinely required.

Prevention of HCC Recurrence with Alpha-Interferon after Liver Resection in HCV Cirrhosis



Mazzaferro V et al Hepatol 2006;44:1543-54

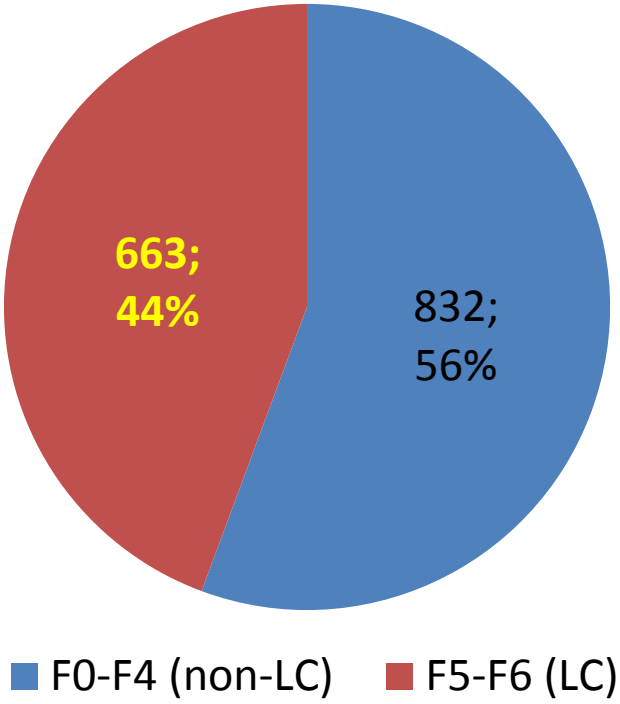
Recurrence of HBV-related HCC after Curative Resection (TCOG, T1297 study)



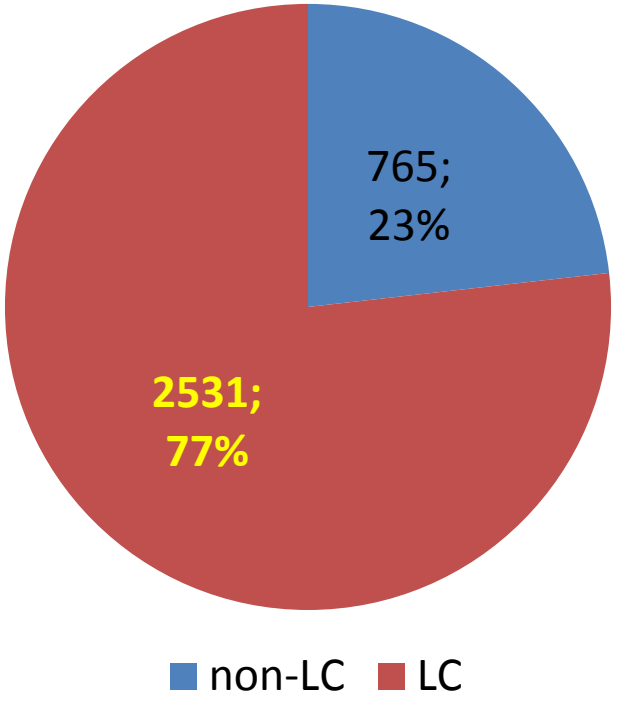
Chen LT et al (unpublished data)

Prevalence of LC in HCC patients (I)

By pathology, surgical patients (surgical treatment)



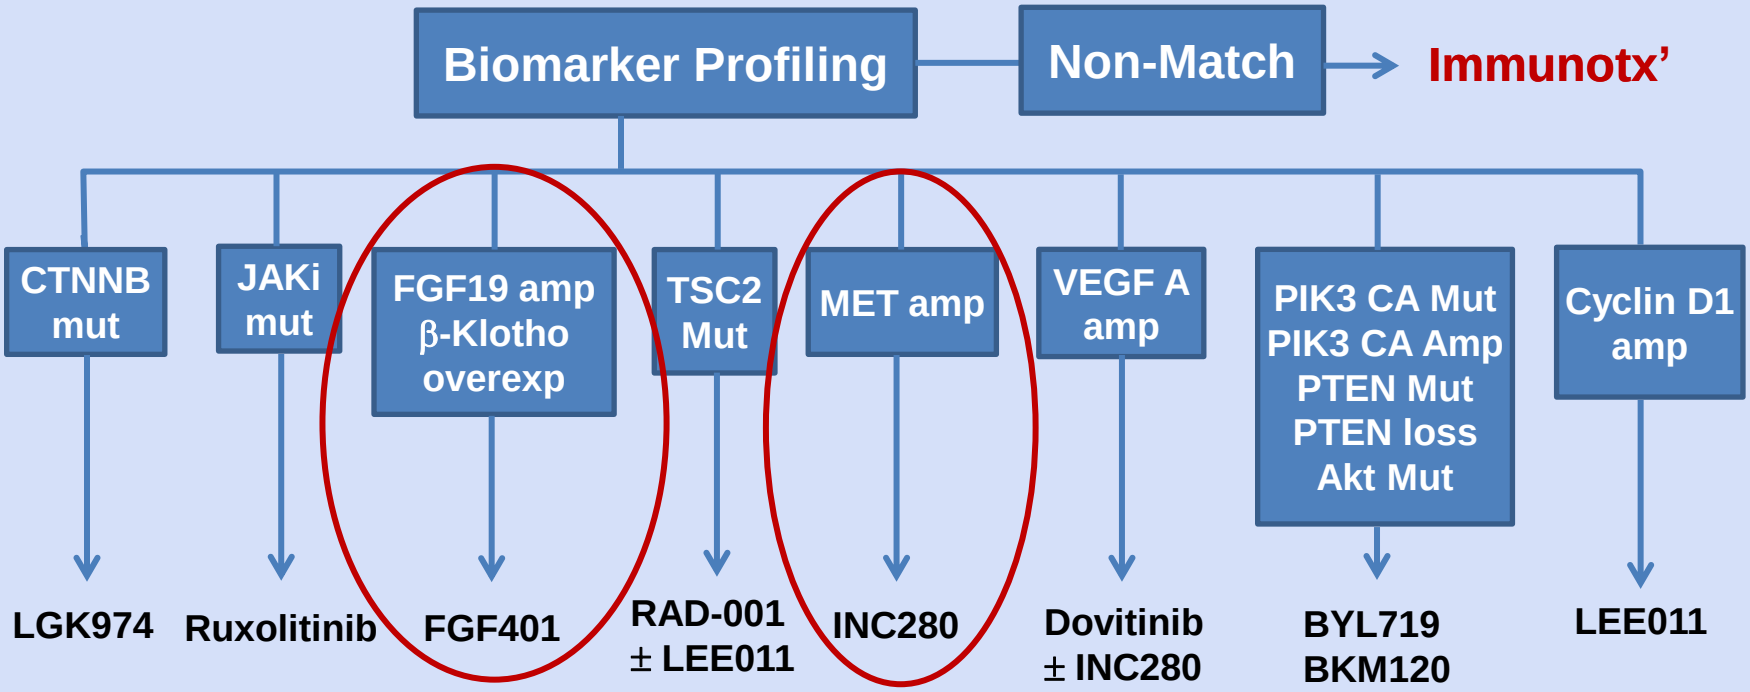
By image, non-surgical patients (non-surgical treatment)



Lu SN et al, unpublished data

Master Protocol for Novartis 2nd-line HCC

- Exploratory, single-arm



Further Phase II if RR > 15% or PFS > 5 months

Linifanib Versus Sorafenib in Patients With Advanced HCC: Results of a Randomized Phase III Trial

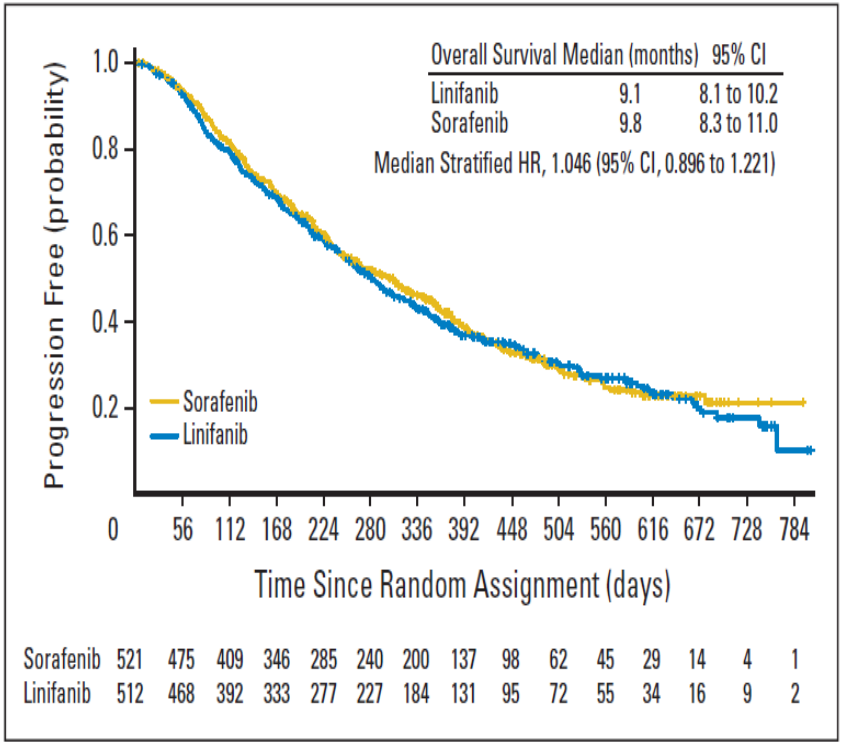


Fig 2. Kaplan-Meier analysis of overall survival with a cutoff point at the 667th patient death. HR, hazard ratio.

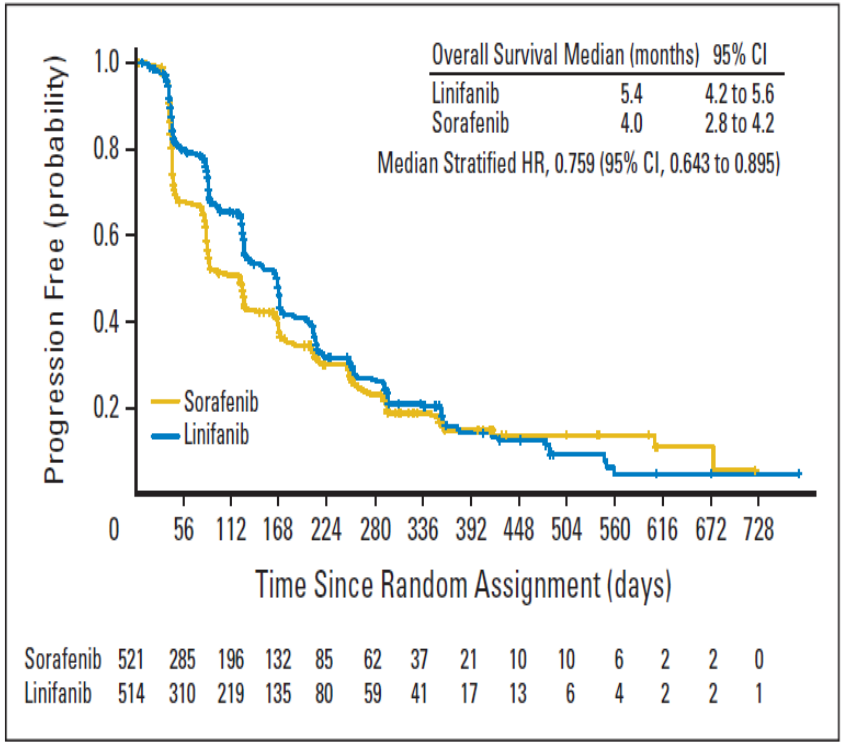

Fig 4. Kaplan-Meier analysis of time to progression. HR, hazard ratio.
