Background

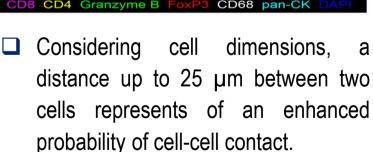

- □ Despite clinical implications, the complexity of brain metastases (BM) immune microenvironment in breast cancer (BC) patients (pts) is still poorly understood.
- ☐ Multiplex immunofluorescence (mIF) simultaneously visualizes several IF labeled proteins while maintaining spatial information and can identify spatially interacting cells, potentially providing useful information to guide therapeutic approaches.

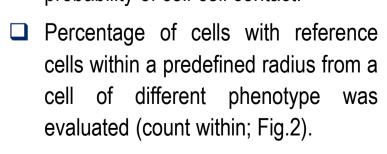

Patients and Methods

- ☐ HER2+ and triple negative (TN) archival BMs for BC pts undergoing neurosurgery (2003-2018) at 3 institutions (ICM, IOV, Montefiore) were collected.
- □ BCBMs were characterized using 2 custom mIF panels for immune cell subtyping and immune checkpoint and co-inhibitory markers (Fig.1).

Fig 1. Example of mIF images of BCBM using the two panels

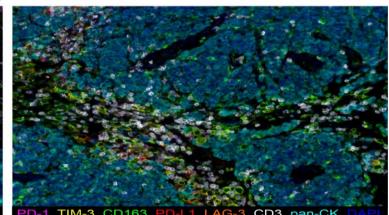

Fig 2. Cell-cell distance analysis example

- ☐ Association between spatially interacting cells and overall survival from BM diagnosis (OS) was tested in each BC subtype separately.
- All tests two-sided (significance p≤0.05).

Results

Forty-one BCBM samples were analyzed. Table 1 reports clinical characteristics.

Table 1. Patient characteristics at BM diagnosis and treatment received							
		HER2	HER2+ (N=23)		TN (N=18)		
		N	%	N	%		
Number of BM	1	18	78.3%	16	88.9%		
	2	2	8.7%	2	11.1%		
	3 or more	3	13.0%	0	0%		
Karnofsky PS	100-90	6	33.3%	5	41.7%		
	80-70	11	61.1%	5	41.7%		
	60 or less	1	5.6%	2	11.1%		
Systemic therapy after BCBM diagnosis		21	91.3%	8	44.4%		
Radiotherapy after BCBM diagnosis		20	87.0%	10	55.6%		

At a median follow-up of 42.6 mos from BM diagnosis, median OS was 53.0 mos (95% CI 28.6-NR mos) and 9.4 mos (95% CI 4.7-NR mos) for HER2+ and TN BCBM pts, respectively.

Immune interactions and and Overall Survival in HER2+ BCBMs

In HER2+ BCBM, PD-1/PD-L1 interaction was significantly associated with worse prognosis (Fig.3a). This is mainly driven by interaction between PD-L1+ CD163+ macrophages and PD-1+ CD3+ lymphocytes (Fig.3b).

Fig 3. Association between immune interactions and OS in HER2+ BCBMs. Median value used to dichotomize each variable and Univariate Cox model HR is reported.

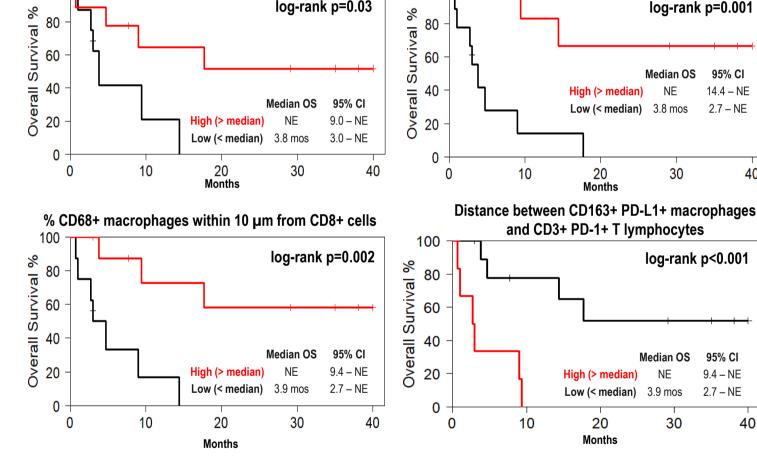

a	Hazard Ratio (high versus low)	95% CI	p-value	
% PD-L1+ cells within 15 um from PD-1+ cells	4.60	1.19-17.68	0.027	•
% PD-L1+ cells within 20 um from PD-1+ cells	4.60	1.19-17.68	0.027	—
% PD-L1+ cells within 25 um from PD-1+ cells	1.53	0.48-4.84	0.468 ———	•
b	Hazard Ratio (high versus low)	95% CI	p-value	
% CD163+PD-L1+ cells within 15 um from CD3+PD-1+ cells	4.99	1.45-17.10	0.011	•
% CD163+PD-L1+ cells within 20 um from CD3+PD-1+ cells	4.99	1.45-17.10	0.011	•
% CD163+PD-L1+ cells within 25 um from CD3+PD-1+ cells	4.02	1.17-13.85	0.027	+ - - - - - - - - - -
		0.1		1 10

Immune interactions and and Overall Survival in TN BCBMs

% CD8+Granzyme B+ T-cells within 10 µm from tumor cells

Differently, in TN BCBM, several immune interactions were associated with better OS (Fig.4). even a shorter distance between CD163+ PD-L1+ macrophages and CD3+ PD-1+ T-cells was associated with better prognosis in TN BCBMs(Fig.4).

Figure 4. OS curves for TNBC pts according to cell-cell immune interactions

Conclusions

- ☐ In HER2+ BCBM, PD-1/PD-L1 interaction appears to negatively impact patient prognosis and might represent a potential therapeutic target.
- ☐ In TN BCBM, a general activation of the immune system is associated with better prognosis. This often involves inhibitory as well as cytotoxic immune components, potentially as a reaction to immune activation.
