

Surgery for recurrent ovarian cancer and palliative surgery

Christina Fotopoulou

Department of Surgery & Cancer

Imperial College London, UK

Surgery for cytoreduction

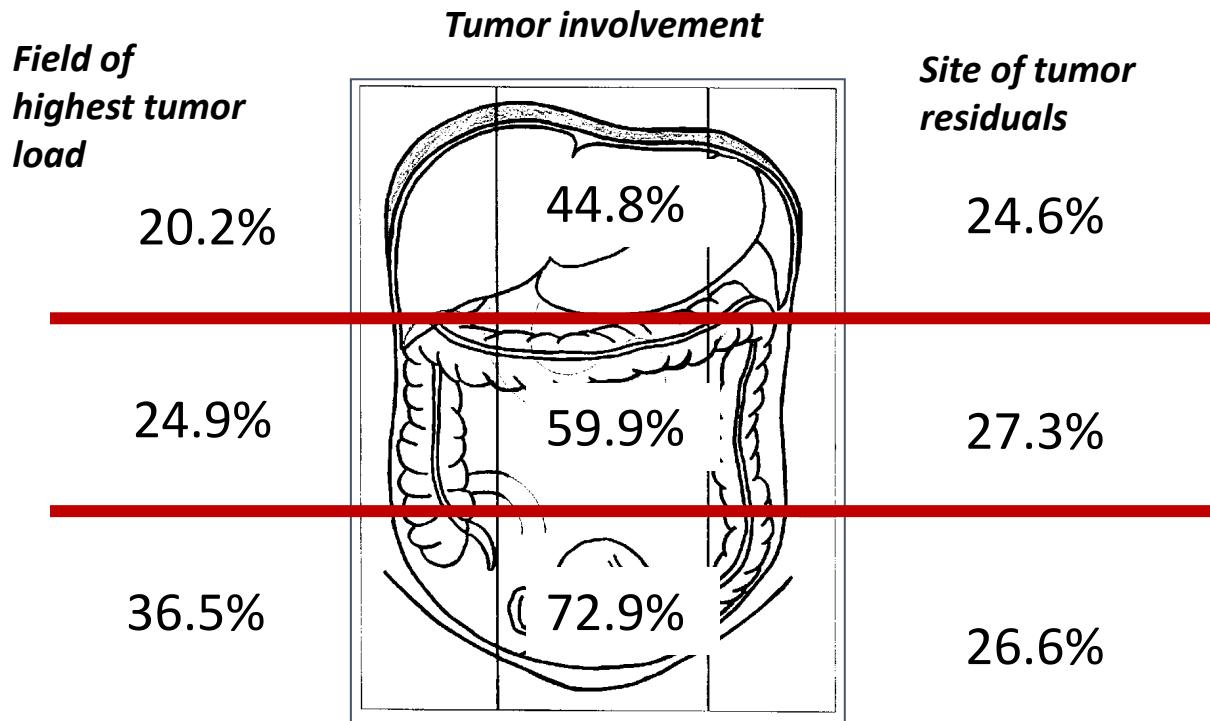

- Surgery in platinum sensitive relapse
- *Objective:* complete tumor resection

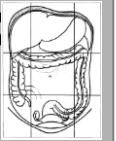

v.s.

Palliative surgery

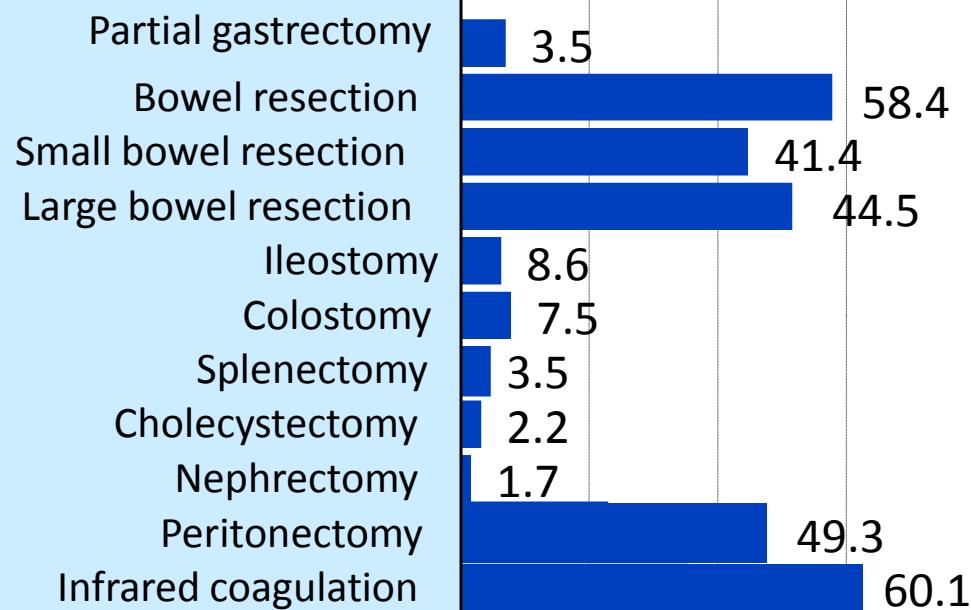

- After failure of all conservative treatments
- *Objective:* Improving of QoL

Tumor dissemination patterns at relapse

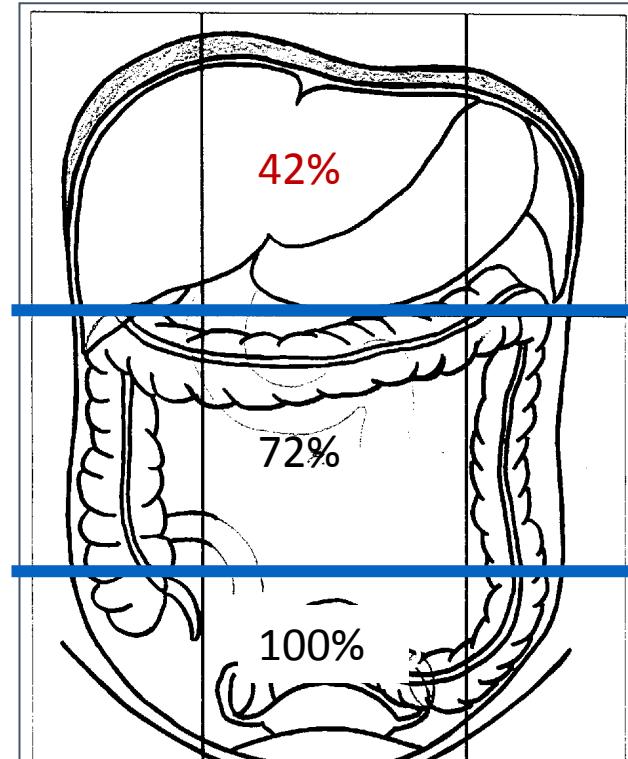

Multivisceral surgical techniques at relapse operation

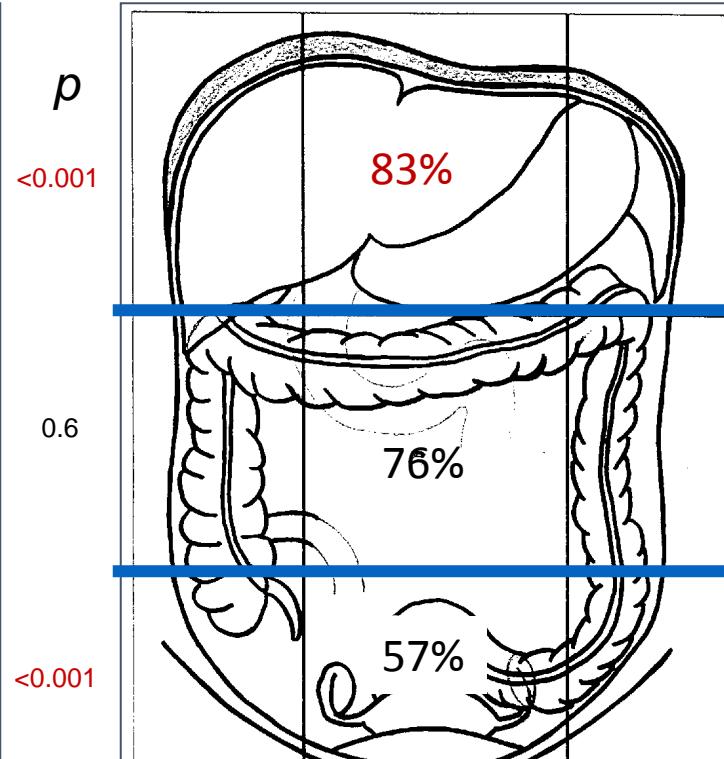

Shifting of tumor burden primary to relapsed disease

Primary

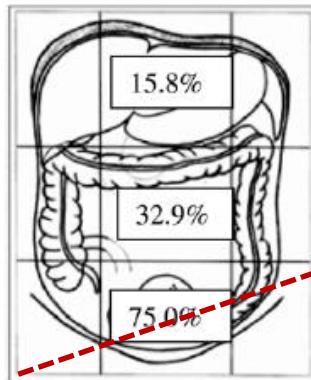

Relapse

No correlation of tumour dissemination patterns in paired primary & relapsed cases

Maximal tumor load

Primary

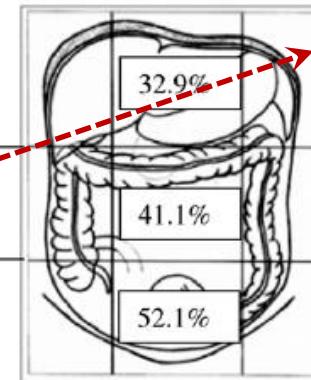

p=0.045

p=0.34

p=0.002

Relapse

peritoneal carcinosis
(RR 1.53;
95% CI: 0.89–2.63)

bowel involvement
(RR 0.92;
95% CI: 0.65–1.31)

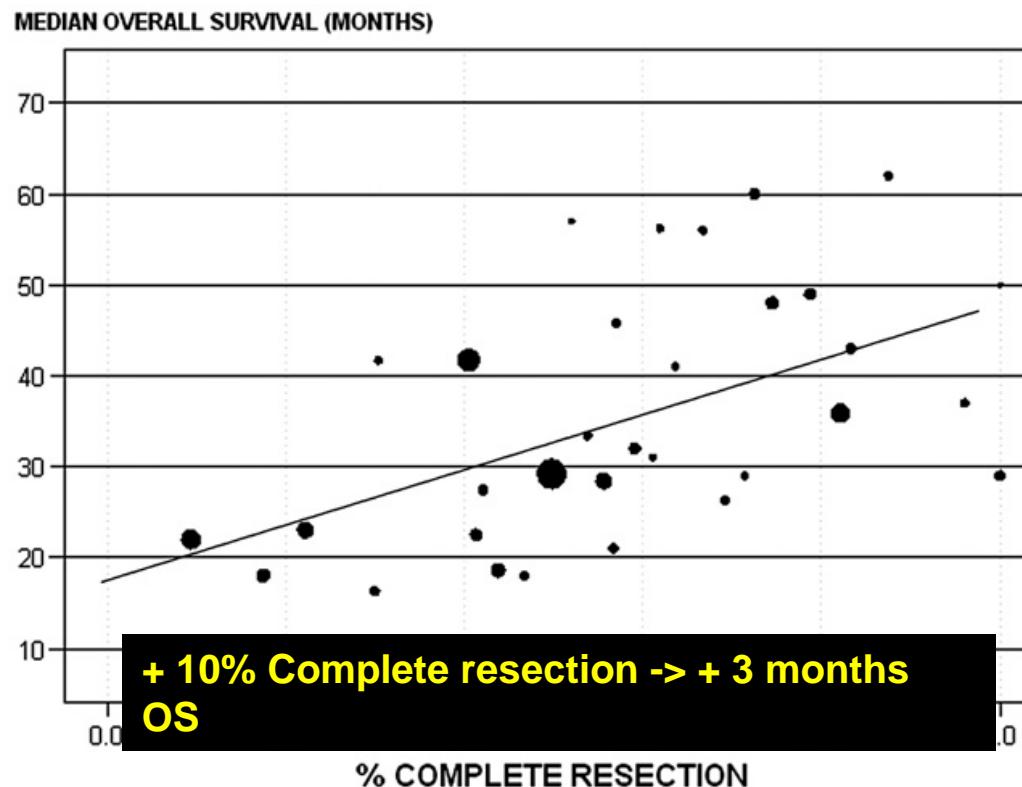

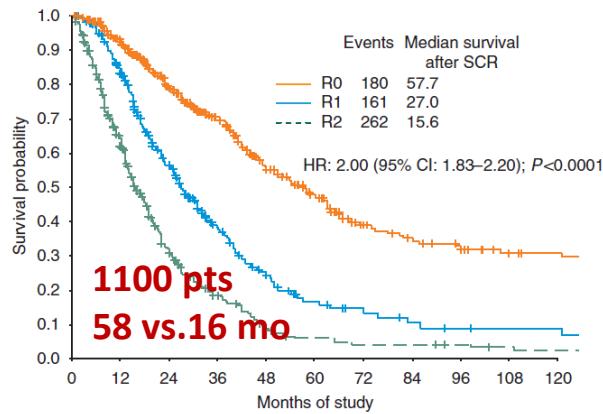

**lymph node
involvement** (RR
1.49; 95% CI: 0.83–
2.68)

Indications for surgical cytoreduction at relapse

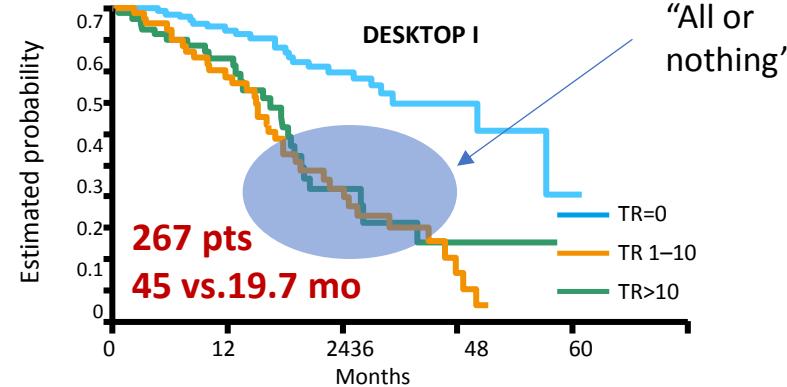

- Early – platinum resistant/
refractory- relapse
 - → NO evidence for survival
benefit in cytoreduction (except
in very rare cases)
 - → median OS \simeq 8-9 months
 - → low complete resection rates
 \simeq 30%
 - → high surgical morbidity
-
- Late – platinum sensitive-
relapse
 - Significant prolongation of OS and
PFS in retrospective trials *in
tumofree pts*
 - High complete tumor resection
rates in selected patient
population
 - Low/ acceptable surgical
morbidity and mortality

Cytoreductive surgery for recurrent OC: a meta-analysis

Third relapse

DESKTOP-OVAR I

Predictive factors for complete tumour resection

Pre-op factor	OR	(95% CI)	p-Value
Performance status (ECOG 0 vs. >0)	2.65	(1.56–4.52)	<0.001
Tumour residuals at primary surgery (0 vs. >0)	2.46	(1.45–4.20)	<0.001
or: initial FIGO (I/II vs. III/IV)	1.87	(1.04–3.37)	0.036
Ascites (cut-off 500 ml)*	5.08	(1.97–13.16)	<0.001

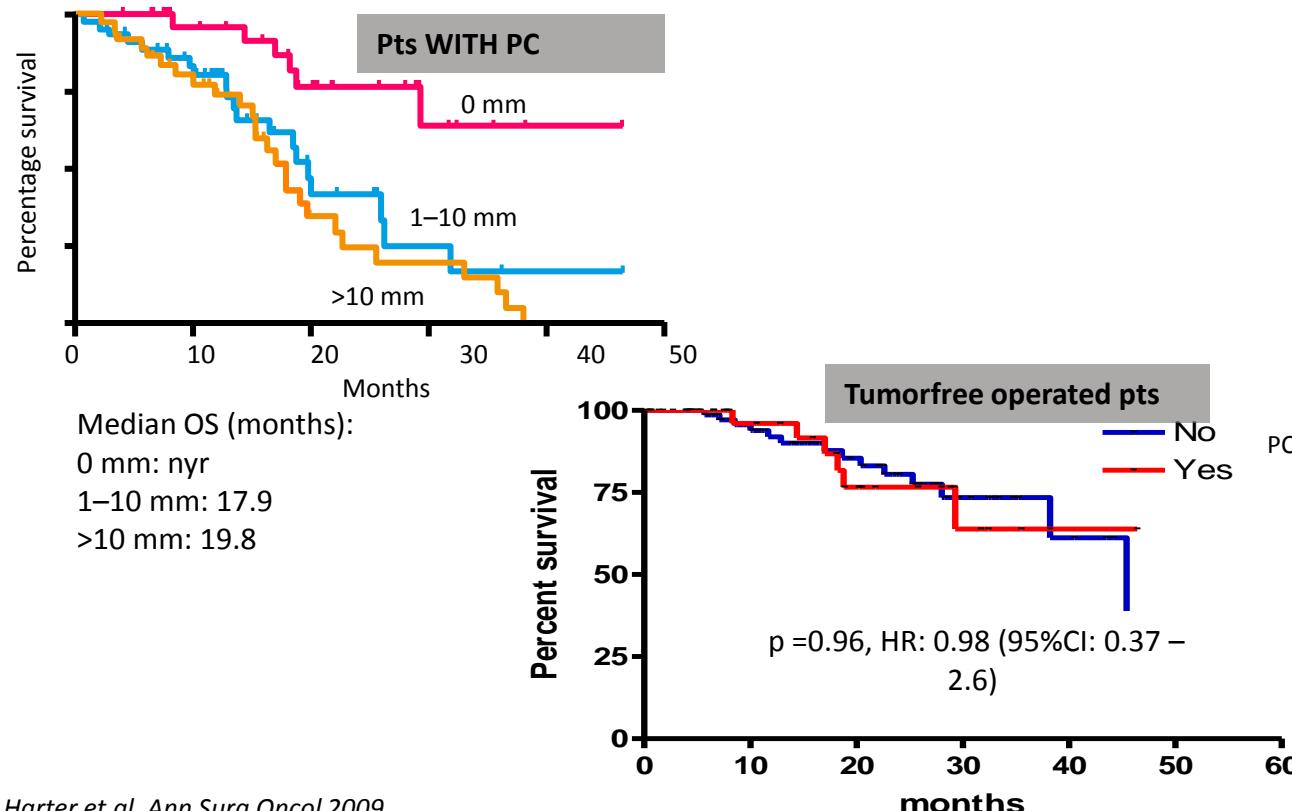

*exclusively CA125 (correlation with ascites)

Multivariate analysis

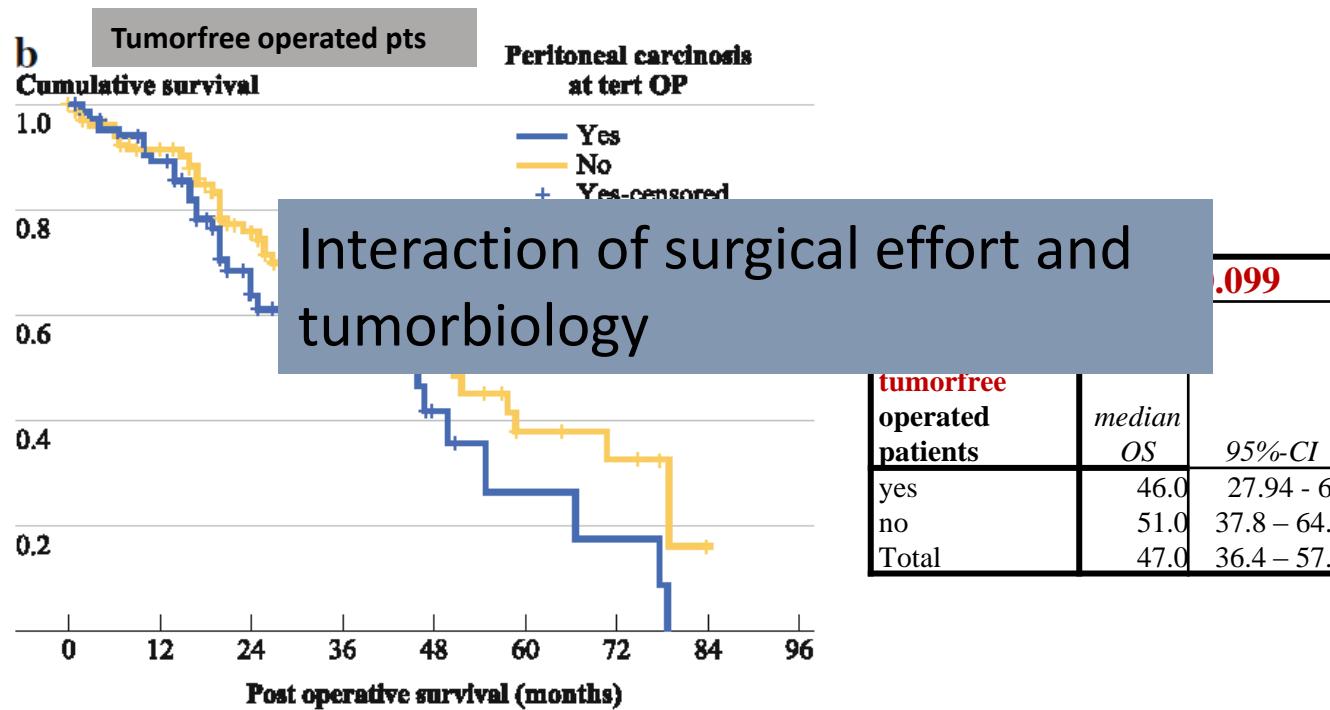

Non-significant for a complete resection:

- Site of relapse (pelvis vs. extra-pelvis)
- Therapy-free interval

Is peritoneal carcinosis/ multifocal relapse a contraindication for secondary cytoreductive surgery? DESKTOP DATA

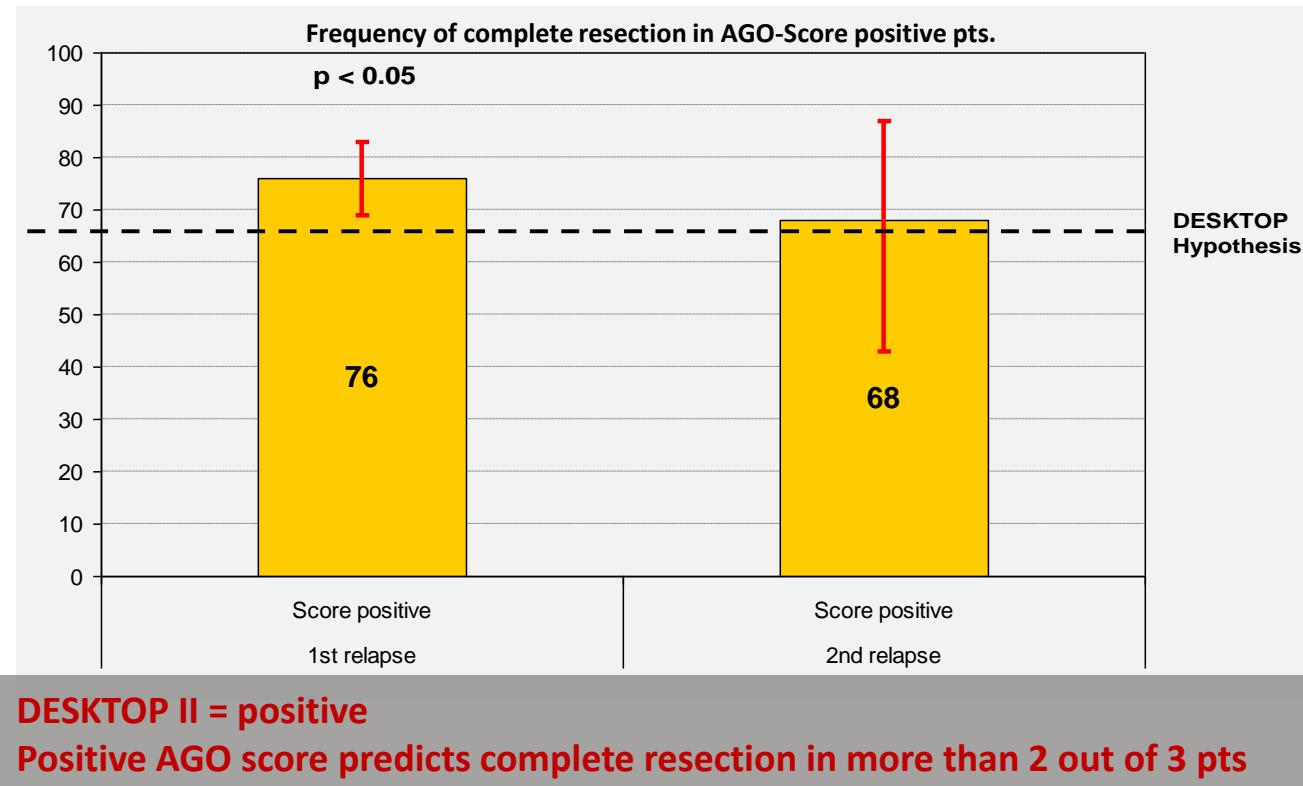

Is peritoneal carcinosis/ multifocal relapse a contraindication for secondary cytoreductive surgery? TCS DATA

AGO-DESKTOP II: An International Multicentre GCIG Trial

Prospective Validation of a Predictive Score for Resectability in Platinum-Sensitive ROC

Timing of Surgery: when to operate?

- CA125 driven follow up?
- Asymptomatic vs symptomatic relapse?
- Operate too early (reduction of QoL) vs too late (low PS)
- Is the retrospective evidence a result of tumorbiology or of surgical effort?

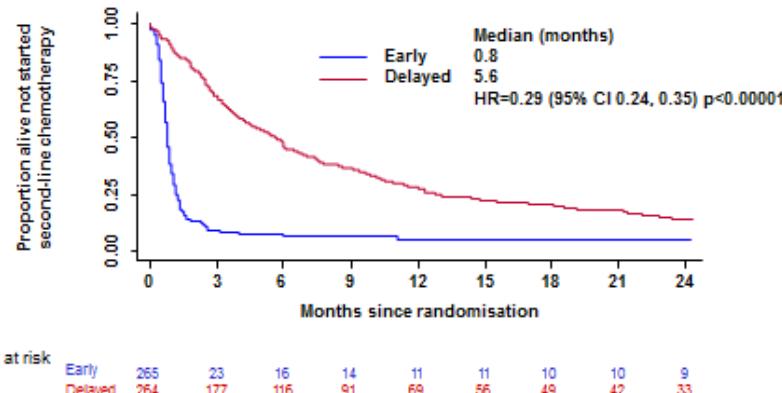

A matter of calendar??
Taking into consideration all
parameters: radicality and
quality of previous surgery,
residual length of bowel, etc

Candidates for surgery

- Rarely relapse diagnosed by symptoms

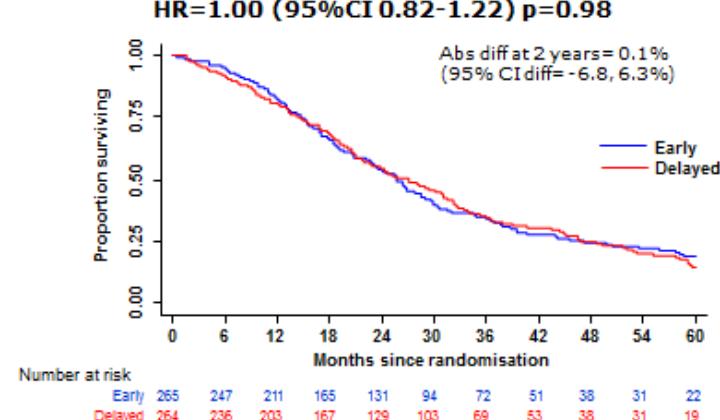

Time from randomisation to second-line chemotherapy

Rustin G, et al. Lancet 2010

ASCO Annual '09 Meeting

Overall Survival

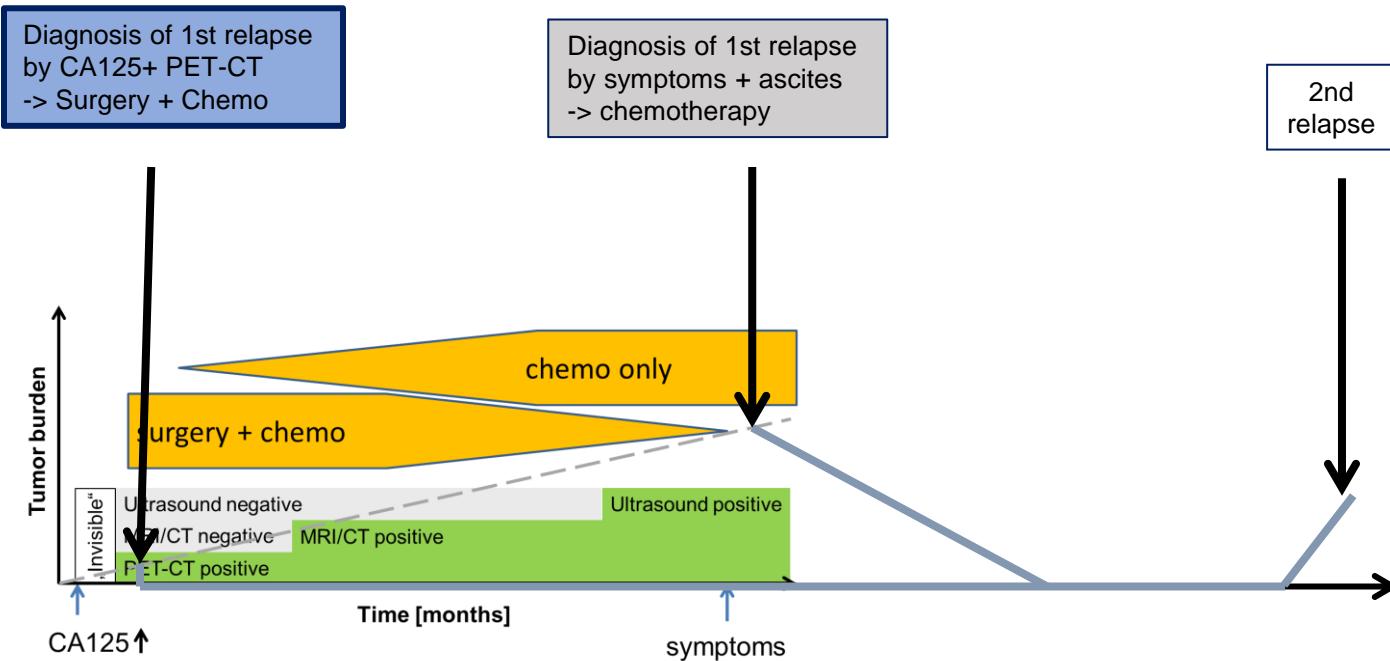

MRC | Medical Research Council

ASCO Annual '09 Meeting

CA-125 elevation 5 months before clinical relapse!

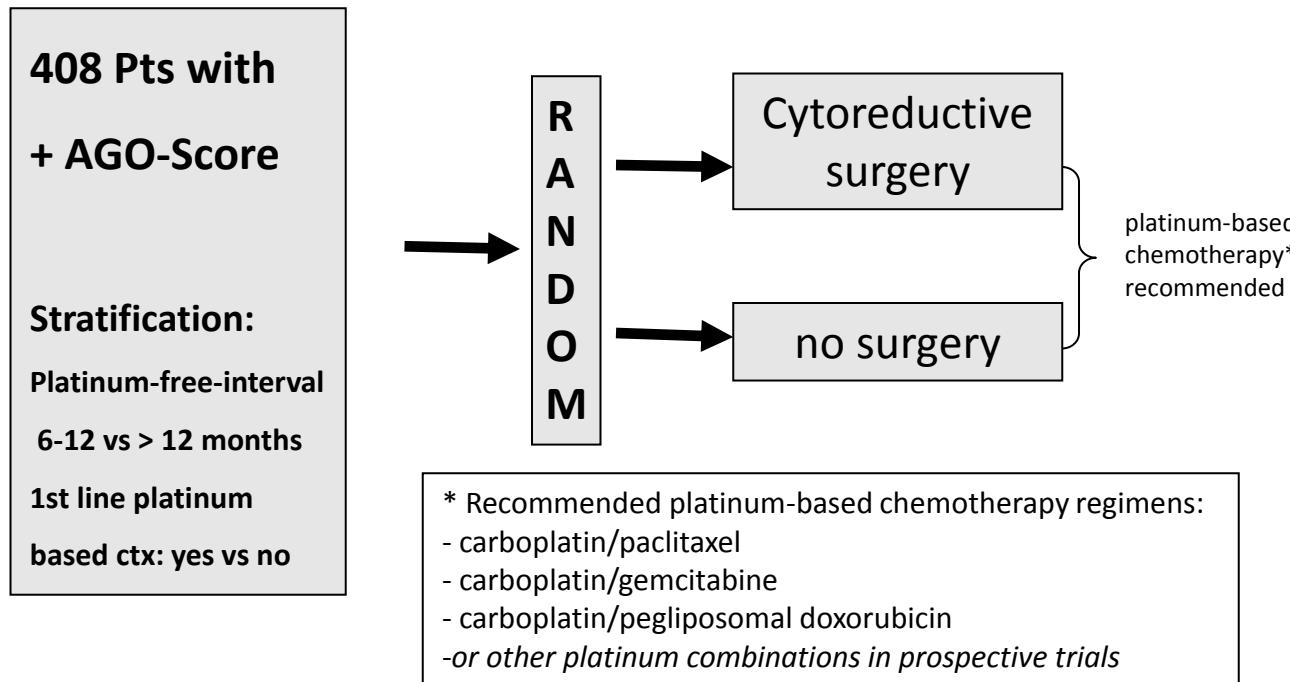

* only ~ 6% with surgery for recurrent disease

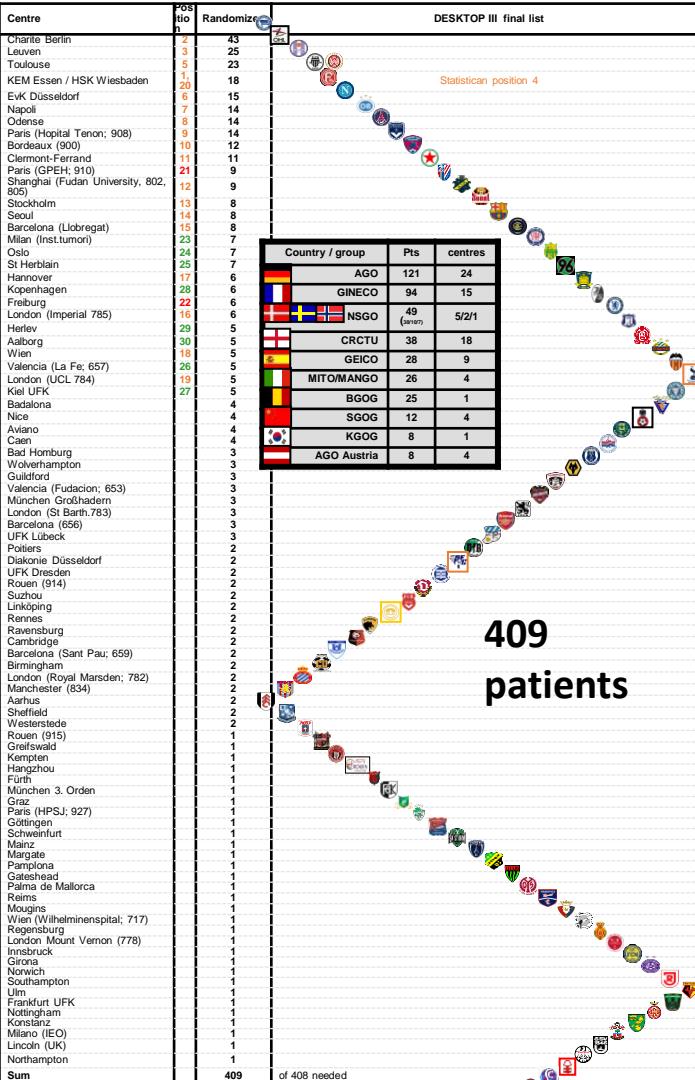

Real benefit by earlier diagnosis and surgery?

AGO-OVAR DESKTOP III (Protocol AGO - OVAR OP.4)

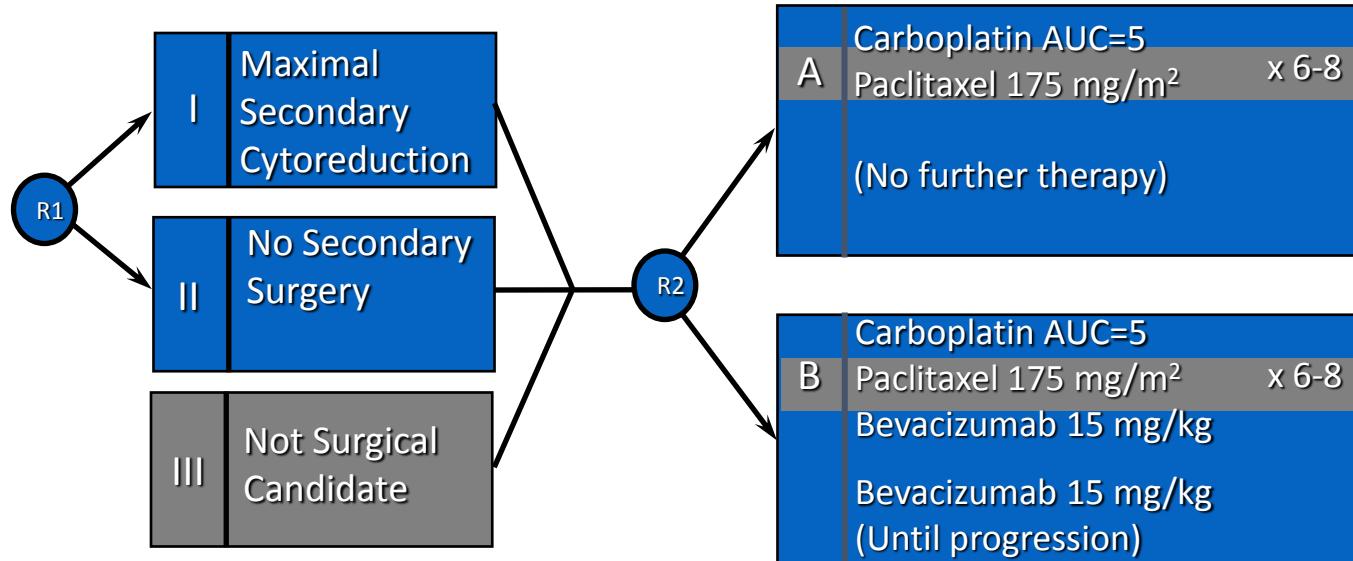

A randomized trial evaluating cytoreductive surgery
in patients with platinum-sensitive recurrent ovarian cancer

GOG 0213: Secondary Cytoreduction

- Epithelial Ovarian, Fallopian, or Peritoneal Cancer
- One prior therapy, Platinum-free interval > 6 months
- Primary Endpoint: OS

•AGO-DESKTOP II – PERIOPERATIVE MORBIDITY

Patients in intensive care unit	67 (52%)
Days intensive care unit [median]	2 (range: 1-20)
No of pts adm. packed blood cells	55 (44%)
No of pts with at least one complication	42 (33%)
Infections requiring antibiotic treatment	31 (24%)
urinary tract	14 (11%)
peritonitis	10 (8%)
pneumonia	4 (3%)
others	7 (5%)
Re-laparotomy	14 (11%)
bowel leakage/perforation	6 (5%)
abscess/infection	3 (2%)
bleeding	3 (2%)
fistula	2 (2%)
Thrombosis / Embolism	3 (2%) / 4 (3%)
Other severe complications	12 (9%)
Mortality within 60 days	1 (0.8%)

Surgical morbidity

Primary Surgery	Year	Patients [n]	Mortality [%]
Aletti	2006	194	1.5
Chi	2010	141	1.4
Harter	2011	187	2.3
Sehouli	2011	332	3.1
Gerestein	2009	pop. based	3.7
Surgery for relapse			
DESKTOP II	2011	129	0.8

Tian	2010	123	0
Sehouli	2010	240	3.8
Oksefjell	2010	217	Not reported

Palliative surgery

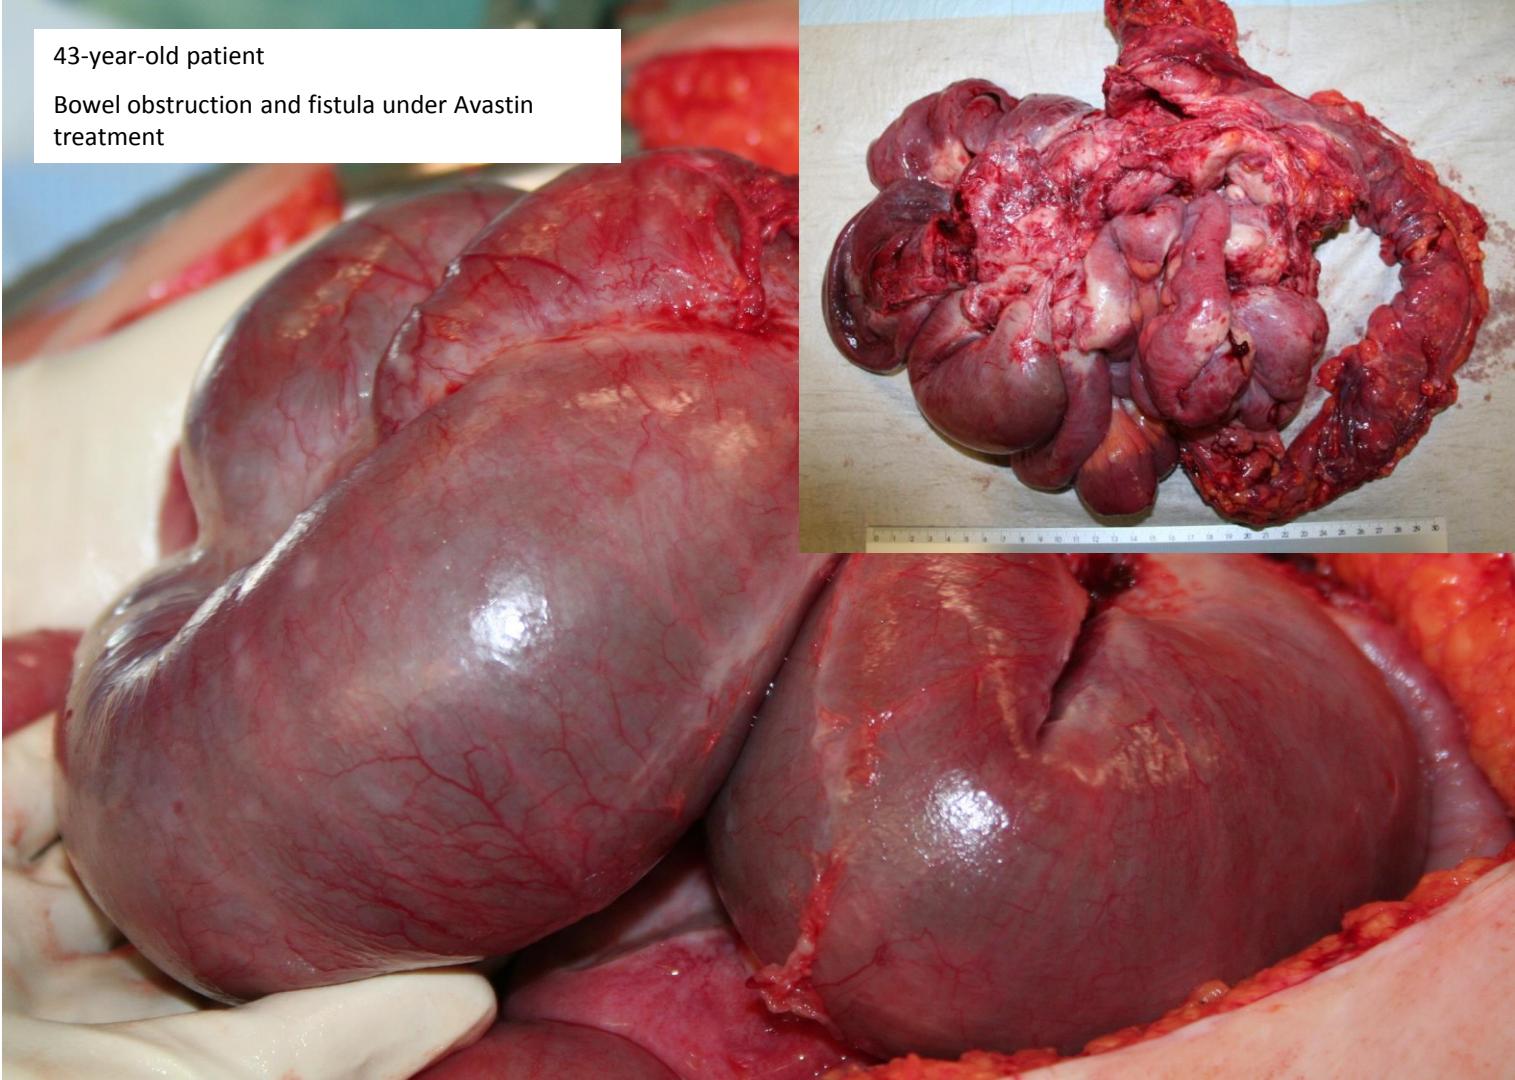

...New Agents On The Horizon

- Chemotherapy: Epothilone, Pemetrexed (Alimta), TLK 286, ...
- Antibodies: Anti-Epcam, ACA125, ...
- EGFR: Gefitinib, Erlotinib, Cetuximab,..
- Antiangiogenesis and VEGF: Bevacizimab, DXMAA, VEGF trap, PIGFab, ..
- c-erb-family (Trastuzumab, pertuzumab, TAK-165, CP724,714, 2C4, IMC-225, EMD72000), Lapatinib (GW572016),
- FTI (Lonafarnib, SCH6636, R115777, BMS214662),
- Raf-1 (Bay 43-90006), MEK (CI-1040), Erbitux, ...
- M-tor inhibitors
- Multiple targets: Enzastaurin, ...

TABLE 2. Data of Perioperative Management, Operative Mortality and Morbidity (n = 44)

	Median (Range)
Operation time, min	270 (148–596)
Transfusion of erythrocyte concentrates, U	2 (0–12)
Length of stay in intensive care unit, d	2.5 (0–31)
Length of hospital stay, d	24 (10–76)
Intestinal length	70 cm (10–180)
<1 m	21 (56.8%)
>1 m	16 (43.2%)

Any major complications	19 (51)
Sepsis	1
Pulmonary embolism	2
Peritonitis	4
Pleura effusion	3
Relaparotomy	12
Anastomotic insufficiency	5
Abscess, secondary wound healing	1
Postoperative bleeding	2
Intestinal perforation	1
Rupture of abdominal wall closure	1
Peritonitis	1

30 day operative mortality: 10%

QoL & Survival

TABLE 4. Assessment of the Quality of Life of the 4 Alive Patients With EOC Who Underwent Salvage Surgery Resulting in SBS According to the SF-12 Health Survey Validated Questionnaire

	Patients With EOC	Healthy Population	P
SF-12 physical score, mean (SD)	36.68 (2.2)	50 (10)	0.009
SF-12 psychological score, mean (SD)	21.36 (6.5)	50 (10)	0.017

The physical and mental scores of the patients were significantly lower than the scores of the general healthy population.

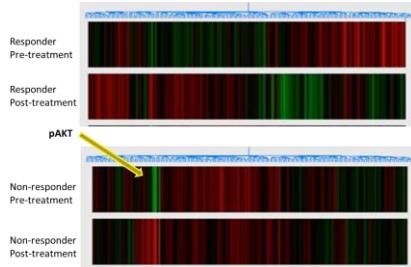

- ✓ Median OS: 5.6 months (range, 0.1-49 months)
- ✓ 1-year and 2-year OS: 18.3% and 8.1%
- ✓ Within a median FU- period of 5 mo (range, 0.2-49 months), 4 patients (10.8%) are still alive.

- ✓ No significant differences in survival were seen between patients with or without major complications, tumor residuals, or residual intestinal length of less than 1 m versus greater than 1 m.

Surgery at relapse

- No value of cytoreduction in „platinum resistant“ patients apart from palliation
- OS and PFS prolongation in tumorfree operated patients (retrospective), data from prospective trials awaited
- Therapeutic decisions individualized and tailored to patients prior treatments, tumor dissemination pattern and patients overall status
- At emergency situations after failure of conservative measures: en-block resection techniques; avoidance of numerous anastomoses; ileostomy/colostomy preferred.
